In February 2013, GlaxoSmithKline (GSK) announced a commitment to further clinical transparency through the public disclosure of GSK Clinical Study Reports (CSRs) on the GSK Clinical Study Register.

The following guiding principles have been applied to the disclosure:

- *Information will be excluded in order to protect the privacy of patients and all named persons associated with the study*
- *Patient data listings will be completely removed* to protect patient privacy. Anonymized data from each patient may be made available subject to an approved research proposal. For further information please see the Patient Level Data section of the* ***GSK Clinical Study Register****.*
- *Aggregate data will be included; with any direct reference to individual patients excluded*

**Complete removal of patient data listings may mean that page numbers are no longer consecutively numbered*

GlaxoSmithKline Biologicals, SA

Study detailed title

A Phase III, randomized, open-label, controlled, multi-center study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa™ vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar® and Rotarix™ with a booster dose of GSK Biologicals' Infanrix® and Hiberix™ vaccines at 15-18 months of age.

Abridged Interim Clinical Study Report for Study 117119 (DTPA-HBV-IPV-135)

This abridged report provides all results available at the time of the database freeze (19 June 2015) which include safety data and immunogenicity data against Polyribosyl-Ribitol-Phosphate (PRP) antigen assessed till Visit 4.

Development Phase III

IND Number: BB-IND 006687

EUDRACT Number: 2013-004304-19

Name of Investigational Product: Infanrix hexa™

Indication Studied: Active immunization against diphtheria, tetanus, pertussis, infection caused by all known subtypes of hepatitis B virus, poliomyelitis, and invasive disease caused by *Haemophilus influenzae* type B (Hib) in infants.

Study initiation date:	16-April-2014
Study completion date:	31-March-2015 (Visit 4)
Data lock point (Date of database freeze):	19-June-2015
Date of report:	Final: 19-October-2015

Sponsor Signatory: Narcisa Elena Mesaros, MD
Project level Clinical Research and Development Lead,
DTP/Polio Vaccines,
Late Clinical Development,
Vaccine Discovery and Development,
GlaxoSmithKline Biologicals, SA.

This study was performed according to the principles of GCP including the archiving of essential documents.

Based on GSK Biologicals' Study Report INS-BIO-CLIN-1010 v05

GLOSSARY OF TERMS

According-To-Protocol:	Included all subjects enrolled in the study who met the criteria defined in the protocol for the considered analysis (reactogenicity or immunogenicity).
Adverse event:	Any untoward medical occurrence in a patient or clinical investigation subject, temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product. An adverse event was therefore any unfavourable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a medicinal product. For marketed medicinal products, this also included failure to produce expected benefits (i.e. lack of efficacy), abuse or misuse.
Eligible:	Qualified for enrolment into the study based upon strict adherence to inclusion/exclusion criteria.
Epoch:	An epoch is a self-contained set of consecutive timepoints or a single timepoint from a single protocol. Self-contained means that data collected for all subjects at all timepoints within that epoch allowed to draw a complete conclusion to define or precise the targeted label of the product. Typical examples of epochs are primary vaccinations, boosters, yearly immunogenicity follow-ups, and surveillance periods for efficacy or safety.
Investigational vaccine/product: **(Synonym of Investigational Medicinal Product)**	A pharmaceutical form of an active ingredient or placebo being tested or used as a reference in a clinical trial, including a product with a marketing authorisation when used in a way different from the approved form, or when used for an unapproved indication, or when used to gain further information about an approved use.
Legally Acceptable Representative:	ICH GCP defines Legally Accepted Representative as an individual or juridical or other body authorised under applicable law to consent, on behalf of a prospective subject, to the subject's participation in the clinical trial.
Randomization:	Process of random attribution of treatment to subjects in order to reduce bias of selection.

Solicited adverse event:	Adverse events recorded as endpoints in the clinical study. The presence/occurrence/intensity of these events was actively solicited from the subject or an observer during a specified post-vaccination follow-up period.
Subject:	Term used throughout the protocol to denote an individual who was contacted in order to participate or participates in the clinical study, either as a recipient of the product(s) or as a control.
Total Vaccinated Cohort:	The Total vaccinated cohort included all subjects with at least one study vaccine administration documented.
Treatment:	Term used throughout the clinical study to denote a set of investigational product(s) or marketed product(s) or placebo intended to be administered to a subject, identified by a unique number, according to the study randomization or treatment allocation.
Unsolicited adverse event:	Any adverse event reported in addition to those solicited during the clinical study. Also any 'solicited' symptom with onset outside the specified period of follow-up for solicited symptoms was reported as an unsolicited adverse event.

TRADEMARKS

The following trademarks are used in the present report.

In the body of the Study Report, (including the synopsis), the names of the vaccines have been written without the superscript symbol ™ or ® and in *italics*.

Trademarks of the GlaxoSmithKline group of companies	Generic description
Engerix-B®	Hepatitis B vaccine (recombinant)
Hiberix™	*Haemophilus* b conjugate vaccine (tetanus toxoid conjugate)
Infanrix®	Diphtheria and Tetanus Toxoids and Acellular Pertussis Vaccine Adsorbed
Infanrix hexa™	Combined Diphtheria-Tetanus-acellular Pertussis (DTaP), Hepatitis B, Poliovirus and *Haemophilus influenzae* type b vaccine
Pediarix®	Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed, Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine
Rotarix®	Rotavirus Vaccine, Live, Oral

Trademarks not owned by the GlaxoSmithKline group of companies	Generic description
ActHIB® (Sanofi Pasteur SA)	*Haemophilus* type b conjugate vaccine (tetanus toxoid conjugate)
Pentacel® (Sanofi Pasteur SA)	Diphtheria and tetanus toxoids and acellular pertussis adsorbed, inactivated poliovirus and *Haemophilus* b conjugate (tetanus toxoid conjugate)
Prevnar13® (Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.)	Pneumoccocal 13-valent conjugate vaccine (diphtheria CRM_{197} protein)

ABRIDGED INTERIM REPORT BODY

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

Study No.: 117119 (DTPA-HBV-IPV-135)

Title of the study: A Phase III, randomized, open-label, controlled, multi-center study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa™ vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar® and Rotarix™ with a booster dose of GSK Biologicals' Infanrix® and Hiberix™ vaccines at 15-18 months of age.

Investigators and study centers: This study was conducted by 32 investigators at multiple centers in the United States of America.

Ethics: The study protocol, amendments, the informed consent, and other information that required pre-approval were reviewed and approved by a national IRB.
Overall this study was to be conducted in accordance with ethical principles that have their origins in the Declaration of Helsinki, the principles of "good clinical practice" (GCP) and all applicable regulatory requirements.
During the course of the study, whenever potential issues with regard to the conduct of the study were identified, either via site monitoring activities or brought to GlaxoSmithKline (GSK) Biologicals' attention by other oversight mechanisms, these issues were investigated and appropriate corrective and/or preventive actions where possible were taken.
Written informed consent was to be obtained from each subject's parent(s)/ legally acceptable representative (LAR) prior to the performance of any study-specific procedures. Electronic Case report forms (eCRFs) were provided for each subject's data to be recorded.
Hepatitis B vaccination history of the subjects, their eligibility criteria and confirmation on Informed Consent Form (ICF) sign off was used in order to ensure the subject's entry and/or randomization in the in the Randomization System on Internet (SBIR). However, two subjects (subject numbers PPD and PPD) enrolled at one site PPD were randomized in the SBIR before the subject's parent(s)/LAR(s) signed the ICF. No other study procedure was performed on these subjects before obtaining consent. This deviation did not result in elimination of the subjects from the According to Protocol (ATP) analyses.

Publication (reference): Not published as of 19 October 2015.

Study period: **Study initiation date:** 16-April-2014 **Study completion date:** 31-March-2015 (Visit 4) **Data lock point (Date of database freeze):** 19-June-2015	**Phase:** III

Indication: Active immunization against diphtheria, tetanus, pertussis, infection caused by all known subtypes of hepatitis B virus, poliomyelitis, and invasive disease caused by *Haemophilus influenzae* type B (Hib) in infants.

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

Objectives: This abridged report provides all results available at the time of the database freeze (19 June 2015) which include safety data and immunogenicity data against Polyribosyl-Ribitol-Phosphate (PRP) antigen assessed till Visit 4.Objectives not relevant to this report (i.e. data not available at the time of the database freeze) are presented in square brackets.

Primary:

Epoch 001: Primary vaccination

- [To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens {pertussis toxoid (PT), filamentous hemagglutinin (FHA) and pertactin (PRN)} one month after the third dose of the primary vaccination.
  - Criterion for non-inferiority*: Non-inferiority in terms of immune response to pertussis antigens will be demonstrated if, for each of the three antigens, the upper limit of the 95% confidence interval (CI) of the GMC ratio [Pedia divided by Hexa] is ≤ 1.5*.]

Secondary:

Epoch 001: Primary vaccination

- To assess the immune response to *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to [diphtheria (D), tetanus (T), hepatitis B surface antigen (HBs), pertussis, poliovirus types 1, 2 and 3] and PRP antigens, one month after the third dose of the primary vaccination.
- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa,* of *Pentacel* co-administered with *Engerix-B,* and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events (AEs), new-onset chronic diseases (NOCDs) and serious adverse events (SAEs).

Epoch 002 : Booster vaccination

- [To assess the immunogenicity of *Infanrix hexa, Pentacel, Engerix-B, Pediarix* and *ActHIB,* in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.]
- [To assess the immune response to *Infanrix, Hiberix, ActHIB* and *Pentacel,* in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix and Pentacel*, one month after the booster dose.]
- [To assess the safety and reactogenicity of booster doses of *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*.]

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

Methodology: This is a phase III, open-label, randomized, controlled, multi-center, single-country study with five parallel groups. The subjects were randomized in a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. The details of the study groups and vaccination schedules are given below:

Epoch 001:

- **Hexa Group:** Subjects in this group received three doses of *Infanrix hexa* (lot A, lot B or lot C as per the group allocation) co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
  - Hexa_1 Group: Subjects received lot A of *Infanrix* hexa,
  - Hexa_2 Group: Subjects received lot B of *Infanrix hexa,*
  - Hexa_3 Group: Subjects received lot C of *Infanrix hexa*.
- **Pedia Group:** Subjects in this group received three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
- **Penta Group**: Subjects in this group received three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

  *Subjects in the Penta Group who received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination should not have received *Engerix-B* at 4 months of age (Visit 2).

Epoch 002:

- **Hexa Group**: Subjects will receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.
- **Pedia Group**: Subjects will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.
- **Penta Group**: Subjects will receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

The study is open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered.

Sampling schedule: One month after the third dose of primary vaccination (Visit 4), a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) was collected.

Study vaccine, dose, mode of administration lot no.:

Vaccination schedule /site:

Three doses of *Infanrix hexa* vaccine (lyophilized Hib vaccine reconstituted with DTPA-HBV-IPV liquid vaccine) were administered at 2, 4 and 6 months of age as an intramuscular (IM) injection in the right thigh.

Vaccine composition /dose /lot number: One dose (0.5 mL) of *Infanrix hexa* contained DT≥30IU; TT≥40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; Aluminium=700µg Al3+ and PRP=10µG; TT~=25µG Aluminum as salts=120 µg.
Lot numbers used were:
AHIBC950C (Hib) + AC21VB448C (Pediarix)
AHIBC907D (Hib) + AC21B514A (Pediarix)
AHIBC954A (Hib) + AC21B510B (Pediarix)

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

Reference vaccine /Comparator, dose and mode of administration, lot no.:
Primary Vaccines

Pediarix:
Vaccination schedule /site: Three doses of *Pediarix* were administered at 2, 4 and 6 months of age as an IM injection in the right thigh.
Vaccine composition /dose /lot number: One dose (0.5 mL) of *Pediarix* contained DT≥30IU; TT≥40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; Aluminium=700µg Al3+.
Lot number used for *Pediarix* was AC21VB448C.

ActHIB:
Vaccination schedule /site: Three doses of *ActHIB* were administered at 2, 4 and 6 months of age as an IM injection in the upper left thigh.
Vaccine composition /dose /lot number: One dose (0.5 mL) of *ActHIB* contained Hib=10µg, TT=24µg and NaCl=60mM.
Lot numbers used for *ActHIB* were UH971AA and UH954AB.

Pentacel:
Vaccination schedule /site: Three doses of *Pentacel* were administered at 2, 4 and 6 months of age as an IM injection in right thigh.
Vaccine composition /dose /lot number: One dose (0.5 mL) of *Pentacel* contained PT=20µg; FHA=20µg; FIM=5µg; PRN=3µg; DT=15Lf; TT=5Lf; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; PRP=10µg, TT=24µg; $AlPO_4$=330µg Al3+.
Lot numbers used for *Pentacel* were C4574AA, C4517BA, C4507AA and C4557AA.

***Engerix-B*:**
Vaccination schedule /site: Two-three doses of *Engerix-B* were administered at 2, 4 (second dose was not given if subjects had received a dose prior to the study) and 6 months of age as an IM injection in the upper left thigh.
Vaccine composition /dose /lot number: One dose (0.5 mL) of *Engerix-B* contained HBsAg=10µg; $Al(OH)_3$=250µg Al3+.
Lot number used for *Engerix-B* was AHBVC253A.

Prevnar13:
Vaccination schedule /site: Three doses of *Prevnar13* were administered at 2, 4 and 6 months of age as an IM injection in the lower left thigh.
Vaccine composition /dose /lot number: One dose (0.5 mL) of *Prevnar13* contained PS1=2.2µg CRM197; PS3=2.2µg CRM197; PS4=2.2µg CRM197; PS5=2.2µg CRM197; PS6A=2.2µg CRM197; PS6B=4.4µg CRM197; PS7F=2.2µg CRM197; PS9V=2.2µg CRM197; PS14=2.2µg CRM197; PS18C=2.2µg CRM197; PS19A=2.2µg CRM197; PS19F=2.2µg CRM197; PS23F=2.2µg CRM197; $AlPO_4$=125µg Al3+.
Lot number used for *Prevnar13* was H39264.

***Rotarix*:**
Vaccination schedule /site: Two doses of *Rotarix* were given orally at 2 and 4 months of age.
Vaccine composition /dose /lot number: One dose (1.0 mL) of Rotarix contained HRV RIX4144=$10^{6.0}$ $CCID_{50}$ (median Cell Culture Infective Dose) and $CaCO_3$=60µg.
Lot numbers used for *Rotarix* were AROTA291D (HRV) and AD05VA833A (CaCO3).

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

Study Population: Healthy males or females between, and including, 6 and 12 weeks of age at the time of the first vaccination were included in the study. The subjects were excluded from the study if they had any previous or intercurrent diphtheria, tetanus, pertussis, polio, hepatitis B, Hib, rotavirus and/or pneumococcal vaccination or disease, with the exception of hepatitis B vaccination at birth. Written informed consent was to be obtained from the parents/LAR(s) of the subject before entry into the study.

Duration of treatment: The intended duration of the study will be approximately 14-17 months for each subject.

Criteria for evaluations: For this abridged report, only the endpoints pertaining to the results for safety and immune response against PRP antigen up to one month after the third dose of primary vaccination were assessed descriptively. Endpoints not relevant to this report are presented within square brackets.

Primary endpoint: ***Epoch 001 (Primary vaccination)***

- [Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.]

Secondary endpoints: ***Epoch 001 (Primary vaccination)***

- [Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa, Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).]
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*.
  - [Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3] and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0-Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0-Day 3) after each vaccination.
- Unsolicited AEs.
  - Occurrence of unsolicited AEs within 31 days (Day 0-Day 30) after each vaccination, according to the Medical Dictionary for Regulatory Activities (MedDRA) classification.
- Specific AEs.
  - Occurrence of specific AEs, i.e., NOCDs (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.
- SAEs.
  - Occurrence of SAEs from Day 0 up to six months post primary vaccination.

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

Epoch 002 (Booster vaccination)

- [Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti-PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).]
- [Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti-PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1.0 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1.0 IU/mL one month after the booster dose (Dose 4).]
- [Immunogenicity with respect to the study vaccine *Infanrix.*
  - Anti-D, anti-T, anti-PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1.0 IU/mL one month after the booster dose (Dose 4).]
- [Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix.*
  - Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1.0 µg/mL one month after the booster dose (Dose 4).]
- [Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0-Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0-Day 3) after booster vaccination.]
- [Unsolicited AEs.
  - Occurrence of unsolicited AEs within 31 days (Day 0-Day 30) after booster vaccination, according to the MedDRA classification.]
- [Specific AEs.
  - Occurrence of specific AEs, i.e., NOCDs (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from the booster dose up to one month after the booster vaccination.]
- [SAEs.
  - Occurrence of SAEs from the booster dose up to one month after the booster vaccination.]

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

Statistical methods: Analyses were performed as stated in the protocol and Statistical analysis plan (SAP).

For this abridged report, the analyses pertaining to immune response to *Infanrix hexa, ActHIB and Pentacel* in terms of antibody titers against PRP antigens (one month after the third dose of the primary vaccination), and safety and reactogenicity to *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B* in terms of solicited local symptoms, solicited general symptoms, unsolicited AEs, NOCDs and SAEs are described below:

Analysis of demographics

Demographic characteristics (i.e. age {weeks}, gender, geographical ancestry, height in length {cm}, weight {kg} at first dose) and withdrawal status were summarized by group using descriptive statistics. Mean, median and standard error were provided for continuous data such as age.

Analysis of immunogenicity

The primary analysis of immunogenicity was performed on the Primary ATP cohort for immunogenicity. Within group assessment was performed for each group, one month post-dose 3 for each assay for which a serological result was available:

- Seropositivity and seroprotection rates with exact 95% CIs were calculated.
- GMCs/GMTs with 95% CIs were tabulated.

For each antigen, antibody concentration or titer distribution one month post-vaccination were tabulated and displayed using reverse cumulative curves (RCCs).

Analysis of safety

The primary analysis was based on the Primary Total Vaccinated cohort (TVC)

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) or 31-day (Days 0-30) follow-up period were tabulated after each vaccine dose and overall (for the Epoch 001) with exact 95% CI.
- The percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 4-day or 31-day follow-up period were tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses with local AEs (solicited and unsolicited) were calculated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines, as well as overall (all sites considered).
- The percentage of subjects/doses with each individual solicited local and general AE during the 4-day follow-up period were tabulated for each group as follows:
  - Over the primary doses, the percentage of subjects with the symptom and its exact 95% CI.
  - Over the primary doses, the percentage of doses with the symptom and its exact 95% CI.
  - At each study dose, the percentage of subjects with the symptom and its exact 95% CI.

The exact 95% CIs were calculated assuming independence between doses.

- All computations mentioned above were done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit.
- For fever, analyses were performed by 0.5°C increments.
- The verbatim reports of unsolicited AEs were reviewed by a clinical research development lead (CRDL) and the signs and symptoms were coded according to MedDRA. Every verbatim term was matched with the appropriate Preferred Term. The percentage of subjects/doses with unsolicited AEs occurring within 31 days with exact 95% CI was tabulated by Preferred Term. Similar tabulations were done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

- Subjects who experienced AEs of specific interest (i.e. NOCDs such as autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to 6 months after the last primary vaccination were tabulated by Preferred Term.
- Subjects who experienced at least one SAE reported before the database lock for the Epoch 001 analysis with an onset date in the Epoch 001 were reported and the SAE was described in detail.

Data Quality assurance at study level: To ensure that the study procedures conformed across all investigator sites, the protocol, eCRF and safety reporting were reviewed with the investigators and his/her/their personnel responsible for the conduct of the study by the Company representatives prior to study start. A multi-investigator meeting was held prior to the study start.
Adherence to the protocol requirements and verification of data generation accuracy were achieved through monitoring visits to each investigator site. Computer checks and blinded review of subject tabulations were performed to ensure consistency of eCRF completion. All procedures were performed according to methodologies detailed in GlaxoSmithKline Biologicals Standard Operating Procedures (SOPs).
All protocol deviations collected during the study were reviewed by the GSK study team in order to identify important protocol deviations. Consistent with ICH E3 guidance, important deviations are defined as deviations that were likely to affect the interpretation of the results and/or led to exclusion of any subject data from an analysis. Important deviations include, but are not limited to, those related to study inclusion or exclusion criteria, adherence to the protocol, conduct of the study, subject management or subject assessment.
We are communicating in this interim report to Center for Biologics Evaluation and Research (CBER) that, since the data were generated with a PRP serology assay not yet fully validated, there is a possibility, though unlikely, that the PRP immunogenicity results might change.

Independent Audit statement:
This study was subjected to audit by GlaxoSmithKline's R&D Global Quality Compliance (GQC)-Clinical Development Quality Assurance. (CDQA) department.

Study population (TVC):

Summary:

Immunogenicity results:

Primary Objective: The primary objective was not evaluated at the time of this interim analysis.

Secondary Objective: Descriptive immunogenicity analysis pertaining to anti-PRP antibody concentrations was performed on the Primary ATP cohort for immunogenicity**.** Table 1 presents the results of the ATP analysis.

- One month after primary vaccination, 94.0% of the subjects in the Hexa group, 98.7% of the subjects in the Pedia group and 98.7% of the subjects in the Penta group had anti-PRP antibody concentrations
  ≥ 0.15 µg/ml.
- One month after primary vaccination, 55.7% of the subjects in the Hexa group, 94.1% of the subjects in the Pedia group and 82.4% of the subjects in the Penta group had anti-PRP antibody concentrations
  ≥ 1.0 µg/ml.

Table 1: Number and percentage of subjects with anti-PRP antibody concentration equal or above 0.15 µg/ml and 1.0 µg/ml and geometric mean concentration (GMC), one month after primary vaccination (Primary ATP cohort for immunogenicity)

				≥ 0.15 µg/ml				≥ 1 µg/ml				GMC		
						95% CI				95% CI			95% CI

Hexa group = Subjects who received three doses of *Infanrix Hexa* and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age; Pedia group = Subjects who received *Pediarix*, *ActHIB* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age; Penta group = Subjects who received *Pentacel*, *Engerix* and; *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age; GMC = geometric mean antibody concentration calculated on all subjects; N = number of subjects with available results; n/% = number/percentage of subjects with concentration equal to or above specified value; 95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Safety results: The safety analysis was performed on the Primary TVC.

Solicited local symptoms: During the 4-day (Days 0-3) post-vaccination period, injection site pain was the most frequently reported solicited local symptom, reported for 67.9%, 82.0% and 79.8% of the subjects in the Hexa, Pedia and Penta groups, respectively. Pain was also the most frequently reported Grade 3 solicited local symptom, reported for 4.3% of the subjects in the Hexa group, 18.0% of the subjects in the Pedia group and 11.7% of the subjects in the Penta group.

Solicited general symptoms: During the 4-day (Days 0-3) post-vaccination period, irritability/fussiness was the most frequently reported solicited general symptom, reported for 87.7%, 96.3% and 94.1% of the subjects in the Hexa, Pedia and Penta groups, respectively. It was also the most frequently reported Grade 3 solicited general symptom, reported for 9.6%, 18.5% and 16.0% of the subjects in the three groups. Grade 3 fever (> 40.0° C axillary temperature) was reported for 1.1% of the subjects in the Pedia group and for none of the subjects in the Hexa and Penta groups.

Unsolicited symptoms: During the 31-day (Days 0-30) post-vaccination period, at least one unsolicited symptom was reported for 56.9%, 55.7% and 49.0% of the subjects in the Hexa, Pedia and Penta groups, respectively. The most frequently reported unsolicited symptom was upper respiratory tract infection, which was reported for 14.9%, 11.9% and 13.3% of the subjects in the Hexa, Pedia and Penta groups, respectively.

Name of company: GlaxoSmithKline Biologicals, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa*	**Name of active substance:** Diphtheria toxoid (DT), tetanus toxoid (TT), pertussis toxoid (PT), filamentous haemagglutinin (FHA), pertactin (PRN), recombinant hepatitis B surface antigen (HBs), poliovirus types 1, 2, 3 and polyribosyl-ribitol-phosphate (PRP).

New onset of chronic diseases (NOCD): At least one NOCD was reported for four subjects (2.1%) in the Hexa group, two subjects (1.0%) in the Pedia group and three subjects (1.5%) in the Penta group up to the data lock point of 19 June 2015. The most frequently reported NOCD was atopic dermatitis, reported for two subjects (1.0%), each, in the Hexa and Penta groups. Bronchial hyperactivity was reported for two subjects (1.0%) in the Hexa group.

Serious adverse events (SAEs): SAEs were reported for seven subjects (3.6%) each in the Hexa and Penta groups and one subject (0.5%) in the Pedia group up to the data lock point of 19 June 2015. Three SAEs were reported in two subjects in the Hexa group that were considered by the investigator to be causally related to the vaccination. Lethargy was reported for one subject (Subject number PP). The subject was hospitalized and the event was resolved on the same day. The subject was withdrawn from the study due to this event. A moderate Grade 2 apparent life threatening event and mild Grade 1 leukocytosis was reported for another subject (Subject number PP) which led to the hospitalization. Both the events were resolved one day after primary vaccination. No fatal events were reported during the study.

Withdrawals due to AEs /SAEs: One subject in the Hexa group withdrew due to an SAE (lethargy) and one in the Penta group withdrew due to a non-serious AE (seizure). In the context of this interim analysis, withdrawal is defined as subjects not having attended Visit 4.

Conclusions:

- One month post primary vaccination, 94.0% of the subjects in the Hexa group and 98.7% of the subjects in the Pedia and Penta groups, had anti-PRP antibody concentrations ≥ 0.15 µg/ml.
- One month post primary vaccination, 55.7% of the subjects in the Hexa group, 94.1% of the subjects in the Pedia group and 82.4% of the subjects in the Penta group had anti-PRP antibody concentrations ≥ 1 µg/ml.
- During the 31-day period following primary vaccination, at least one unsolicited symptom was reported for 111 subjects (56.9%) in the Hexa group, 108 subjects (55.7%) in the Pedia group and 96 subjects (49.0%) in the Penta group.
- During the primary phase of the study (up to the data lock point of 19 June 2015), SAEs were reported for seven subjects each in the Hexa and Penta groups and one subject in the Pedia group. Three SAEs reported for two subjects in the Hexa group (lethargy in one subject and apparent life threatening event along with leukocytosis in the other subject) were considered by the investigator to be causally related to the vaccination. No fatal events were reported during the study.

Date of report: Final:19-October-2015

Statistical Analysis Plan

Study alias & e-track number(s): DTPA-HBV-IPV-135 (117119)

Detailed Title:	A Phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa™ vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar® and Rotarix™ with a booster dose of GSK Biologicals' Infanrix® and Hiberix™ vaccines at 15-18 months of age

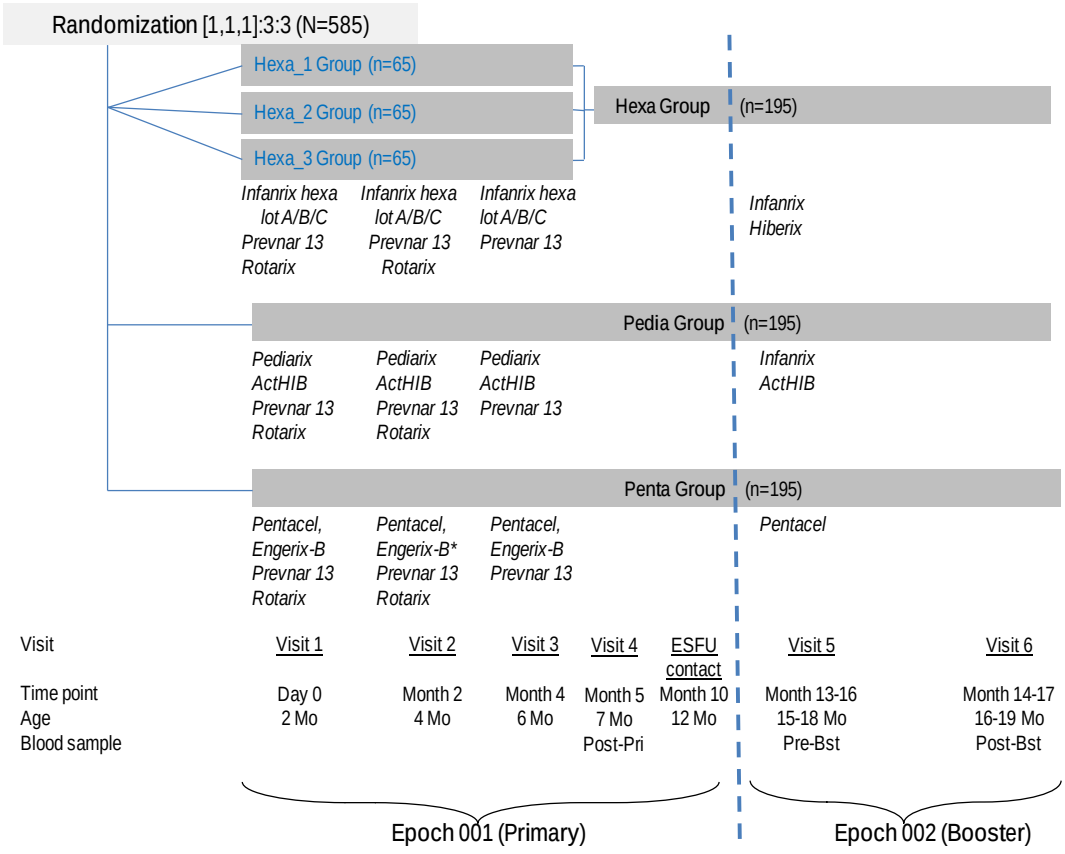
1. DOCUMENT HISTORY

Date	Description	Protocol Version
10-Mar-2015	Version 1	Protocol Amendment 1 - 18-SEP-2014
06-May-2015	*Version 2. The SAP has been updated to incorporate the changes in the sequence of analysis as per the protocol amendment 2*	*Protocol Amendment 2 - 17-Apr-2015*

The complete statistical analysis plan and results presentation is divided into 2 parts: the first part detailing the analyses to be performed (known as SAP, current document) and a second part, annex (-es) (called TFL) describing the flow and format of tables, figures and listings to be annexed to the SR. For this study, there is only one annex TFL.

2. STUDY DESIGN



N = number of subjects in the study; n = number of subjects in each group; Mo = months
Visit 3 should be conducted at least 8 weeks after Visit 2, with subjects at least 24 weeks of age, in order to comply with US recommendations on hepatitis B dosing
Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002
* *Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group
ESFU = Extended safety follow-up

- Experimental design: Phase III, open-label, randomized, controlled, multi-centric, single-country study with five parallel groups

- Duration of the study: The intended duration of the study per subject is approximately 14-17 months.

  - **Epoch 001:** Primary, starting at Visit 1 (Day 0) and ending at safety follow up contact (i.e. six months following the third dose, Month 10),

  - **Epoch 002:** Booster, starting at Visit 5 (Month 13-16) and ending at Visit 6 (Month 14-17).

- Control: active controls.
  - Epoch 001: *Pediarix* + *ActHIB* and *Pentacel* + *Engerix-B*
  - Epoch 002: *Infanrix* + *ActHIB* and *Pentacel.*

- Vaccination schedules:

  Epoch 001

  - **Hexa Group:** Subjects in this group will receive three doses of *Infanrix hexa* (lot A, lot B or lot C as per the group allocation) co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
    - Hexa_1 Group: Subjects will receive lot A of *Infanrix hexa,*
    - Hexa_2 Group: Subjects will receive lot B of *Infanrix hexa*
    - Hexa_3 Group: Subjects will receive lot C of *Infanrix hexa*.
  - **Pedia Group:** Subjects in this group will receive three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
  - **Penta Group**: Subjects in this group will receive three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

*Subjects in the Penta Group who have received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination should not receive Engerix-B at 4 months of age (Visit 2).

Epoch 002

- **Hexa Group**: Subjects will receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.
- **Pedia Group**: Subjects will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.
- **Penta Group**: Subjects will receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

The fourth dose of pneumococcal conjugate vaccine is recommended to be administered at approximately 12-15 months of age. Since the booster dose of the candidate vaccine/active controls will be given in this study at 15-18 months of age, the fourth dose of *Prevnar13* will not be administered as part of the study protocol. Subject's parent(s)/Legally Acceptable Representative(s) (LARs) will be reminded at Visit 3 and Visit 4 to consult their primary health care provider regarding the fourth dose of *Prevnar13* at 12-15 months for their child.

- As the analyses will be performed regardless of the lot of *Infanrix hexa* received, unless otherwise specified, the Hexa_1, Hexa_2 and Hexa_3 groups will be pooled together for the analysis and will be called the Hexa group.

- Treatment allocation: The subjects will be randomized at a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. This will be done at study entry using GSK Biologicals' central randomization system on internet (SBIR).

- Blinding: The study is open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing will be blinded to the treatment, and codes will be used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

- Sampling schedule: Blood samples will be drawn from all subjects at the following time points:
  - Post-Pri (Visit 4): One month after the third dose of primary vaccination, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Pre-Bst (Visit 5): Before the administration of the booster dose, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.

- Post-Bst (Visit 6): One month after the booster vaccination, a volume of at least 3.5 mL of whole blood (to provide at least 1.2 mL of serum) will be collected.

- Type of study: Self-contained.

The following group names will be used for the statistical analyses for Epoch 001:

Group order in tables	Group label in tables	Group definition for footnote	Pooled Groups label in tables	Pooled definition for footnote
1	Hexa_1 group	Subjects who received three doses of *Infanrix Hexa* from lot A and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age	Hexa group	Subjects who received three doses of *Infanrix Hexa* and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
2	Hexa_2 group	Subjects who received three doses of *Infanrix Hexa* from lot B and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age	Hexa group	Subjects who received three doses of *Infanrix Hexa* and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
3	Hexa_3 group	Subjects who received three doses of *Infanrix Hexa* from lot C and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age	Hexa group	Subjects who received three doses of *Infanrix Hexa* and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
4	Pedia group	Subjects who received *Pediarix*, *ActHIB* and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age	Pedia group	Subjects who received *Pediarix*, *ActHIB* and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
5	Penta group	Subjects who received *Pentacel*, *Engerix* and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age	Penta group	Subjects who received *Pentacel*, *Engerix* and *Prevnar 13* at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age

The following group names will be used for the statistical analyses for Epoch 002:

Group order in tables	Group label in tables	Group definition for footnote

1	Hexa group	Subjects who received a primary dose of *Infanrix Hexa* and booster dose of *Infanrix and Hiberix* vaccines at 15-18 months of age
2	Pedia group	Subjects who received a primary dose of *Pediarix* and booster dose of *Infanrix and ActHIB* vaccines at 15-18 months of age
3	Penta group	Subjects who received a primary dose of *Pentacel* and booster dose of *Pentacel* vaccine at 15-18 months of age

3. OBJECTIVES

3.1. Primary objective

3.1.1. Epoch 001 (Primary vaccination)

- To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens [pertussis toxoid (PT), filamentous hemagglutinin (FHA) and pertactin (PRN)] one month after the third dose of the primary vaccination.

  Criteria for non-inferiority:

  Non-inferiority in terms of immune response to pertussis antigens will be demonstrated if, for each of the three antigens, the upper limit of the 95% confidence interval (CI) on the GMC ratio [Pedia divided by Hexa] is ≤ 1.5.

3.2. Secondary objectives

3.2.1. Epoch 001 (Primary vaccination)

- To assess the immune response to *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to D, T, HBs, pertussis, poliovirus types 1, 2 and 3 and PRP antigens, one month after the third dose of the primary vaccination.
- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa*, of *Pentacel* co-administered with *Engerix-B*, and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events, new-onset chronic diseases (NOCDs) and serious adverse events.

3.2.2. Epoch 002 (Booster vaccination)

- To assess the immunogenicity of *Infanrix hexa, Pentacel, Engerix-B, Pediarix* and *ActHIB*, in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.
- To assess the immune response to *Infanrix, Hiberix, ActHIB* and *Pentacel*, in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix and Pentacel*, one month after the booster dose.

- To assess the safety and reactogenicity of booster doses of *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*.

4. ENDPOINTS

4.1. Primary endpoint

4.1.1. Epoch 001 (Primary vaccination)

- Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.

4.2. Secondary endpoints

4.2.1. Epoch 001 (Primary vaccination)

- Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa*, *Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa*, *Pediarix*, *ActHIB*, *Pentacel* and *Engerix-B.*
  - Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3 and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after each vaccination.
- Unsolicited adverse events.

- Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after each vaccination, according to the **Med**ical **D**ictionary for **R**egulatory **A**ctivities (MedDRA) classification.

- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.

- Serious adverse events.
  - Occurrence of serious adverse events from Day 0 up to six months post primary vaccination.

4.2.2. Epoch 002 (Booster vaccination)

- Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).

- Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).

- Immunogenicity with respect to the study vaccine *Infanrix.*
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).

- Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix.*

- Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
- Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4)

- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after booster vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after booster vaccination, according to the MedDRA classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from the booster dose up to one month after the booster vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from the booster dose up to one month after the booster vaccination.

5. STUDY POPULATION

Six cohorts are defined for the purpose of the analysis:

- Primary Total Vaccinated cohort
- Primary ATP cohort for analysis of safety
- Primary ATP cohort for analysis of immunogenicity
- Booster Total Vaccinated cohort
- Booster ATP cohort for analysis of safety
- Booster ATP cohort for analysis of immunogenicity

5.1.1. Primary Total vaccinated cohort

The Primary Total Vaccinated cohort (TVC) will include all vaccinated subjects for whom data are available.

- A safety analysis based on the Primary TVC will include all subjects with at least one vaccine administration documented.
- An immunogenicity analysis based on the Primary TVC will include all vaccinated subjects for whom data concerning at least one immunogenicity endpoint measure is available.

5.1.2. Primary ATP cohort for analysis of safety

The Primary ATP cohort for safety will consist of all subjects from the Primary TVC who complied with the protocol up to the end of Epoch 001, namely all subjects:

- who meet all inclusion criteria and no exclusion criteria for the study
- who have received all planned study vaccines for each completed vaccination visit in Epoch 001;
- for whom administration site of study vaccines is known and is according to protocol;
- who did not receive a product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.7.2 of the protocol.

Note that for the purpose of ATP cohort definition, the Epoch 001 ends at Visit 4.

Adherence to the interval related to ESFU phone contact will not be taken into account for inclusion in ATP cohort for safety.

5.1.3. Primary ATP cohort for analysis of immunogenicity

The Primary ATP cohort for immunogenicity will consist of all subjects from the Primary ATP cohort for safety who complied with eligibility criteria and study procedures (see Table 5 of the protocol for the definition of the intervals) up to the post-dose 3 blood sample and had immunogenicity results for the post-dose 3 blood sample. The analysis will be performed per treatment (first dose) actually administered.

More specifically, the analysis post-dose 3 based on the ATP cohort for immunogenicity will include all eligible subjects:

- who receive all the study vaccines up to dose 3 as per the vaccination schedule;

- for whom administration site and route of study vaccines up to dose 3 is as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.7.2 of the protocol
- who did not present with a medical condition before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.8 of the protocol.
- who comply with the post-dose 3 blood sample schedule, i.e. 21-48 days post-dose 3.
- who were not administered a vaccine not foreseen by the study protocol before the corresponding post-vaccination blood sample.
- who have immunogenicity results post-dose 3.

5.1.4. Booster Total vaccinated cohort

The Booster TVC will include all subjects from primary TVC that received the booster vaccine dose.

- For the Booster-TVC analysis of safety, this will include all subjects with booster vaccine administration documented.
- For the Booster-TVC analysis of immunogenicity, this will include vaccinated subjects for whom data concerning immunogenicity endpoint measures are available.

5.1.5. Booster ATP cohort for analysis of safety

The Booster ATP cohort for safety will consist of all subjects from the Booster TVC who complied with the protocol up to the end of Epoch 002, namely all subjects:

- who meet all inclusion criteria and no exclusion criteria for the study
- who have received the planned booster dose at 15-18 months of age;
- who received 3 doses in Epoch 001;
- for whom administration site of study vaccines is known and is according to protocol;
- who did not receive a product before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis as listed in Section 6.7.2 of the protocol.

5.1.6. Booster ATP cohort for analysis of immunogenicity

The Booster ATP cohort for immunogenicity will consist of all subjects from the Booster ATP cohort for safety who complied with eligibility criteria and study procedures (see Table 5 of the protocol for the definition of the intervals) up to the post-dose 4 blood sample and had immunogenicity results for the post-dose 4 blood sample.

More specifically, the analysis pre- and post-dose 4 based on the Booster ATP cohort for immunogenicity will include all eligible subjects:

- who receive all the study vaccines up to dose 4 as per the vaccination schedule;
- for whom administration site and route of the study vaccines up to dose 4 is as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis (see Section 6.7.2 of the protocol);
- who did not present with a medical condition before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis (see Section 6.8 of the protocol);
- who comply with the booster vaccination schedule at 15-18 months of age and with the post-dose 4 blood sample schedule i.e. 21-48 days for post-dose 4;
- who have immunogenicity results post-dose 4.

The list of applicable elimination codes for each cohort can be found in the study specific form FORM-BIO-CLIN-9004-05 Criteria for eliminating subjects from the analyses.

Cohort	Elimination codes	Eli Type
Primary ATP cohort for analysis for safety	1030-2100	PR
Primary ATP cohort for analysis for immunogenicity	1030-2100	PR
Booster ATP cohort for analysis for safety	1030-2100	BO
Booster ATP cohort for analysis for immunogenicity	1030-2100	BO

6. STATISTICAL METHODS

6.1. Final analysis of the Epoch 001

6.1.1. Analysis of demographics

Demographic characteristics (age [weeks], gender, geographical ancestry, height in length [cm], weight [kg] at first dose, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status will be summarised by group using descriptive statistics:

Frequency tables will be generated for categorical variables such as center;

Mean, median and standard error will be provided for continuous data such as age.

The distribution of subjects enrolled among the study sites will be tabulated as a whole and per group.

6.1.2. Analysis of immunogenicity

The primary analysis will be based on the Primary ATP cohort for immunogenicity. An analysis on the Primary Total Vaccinated cohort will be performed only if, in any vaccine group and at any time point, more than 5% of the vaccinated subjects with immunological data post-dose 3 are excluded from the Primary ATP cohort for immunogenicity.

The following section describes the analyses that will be performed.

6.1.2.1. Within group assessment

For each group, one month post-dose 3 and for each assay for which a serological result is available:

- Seropositivity and seroprotection rates with exact 95% CIs will be calculated.
- GMCs/GMTs with 95% CIs will be tabulated.
- For each antigen, antibody concentration or titer distribution one month post-vaccination will be tabulated and displayed using reverse cumulative curves (RCCs).

All the above within group analysis for Epoch 001 except the reverse cumulative curves will also be performed by gender, by geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry), by Tdap vaccination history of mothers during pregnancy and by Hepatitis B vaccination of the subjects at birth (for anti-HBs antigen).

6.1.2.2. Between group assessment

At one month post-dose 3,

- The asymptotic standardized 95% CI for the group difference (Pedia group minus Hexa group and Penta group minus Hexa group) in the seropositivity/ seroprotection rates will be computed for each antigen except for group difference (Penta group minus Hexa group) in the seroprotection/ seropositivity rates for pertussis antigens.
- The 95% CI for each group GMC/GMT ratio (Pedia group divided by Hexa group and Penta group divided by Hexa group) will be computed using an Analysis of Variance (ANOVA) model on the logarithm-transformed concentrations/titers except for GMC ratio (Penta group divided by Hexa group) for pertussis antigens. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis b at birth vaccine dose status will also be used as regressor leading to an Analysis of Co-variance (ANCOVA) model. The model will include the data from the 2 groups compared. For analysis purpose, we will consider DTP vaccination of the mother during pregnancy as continuous variable.

6.1.2.3. Interpretation of analyses

Except for analyses addressing criteria specified in the primary objective, comparative analyses will be descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses should not be interpreted for formal conclusions since there is no adjustment for multiplicity of endpoints.

6.1.3. Analysis of safety

The primary analysis will be based on the primary Total Vaccinated cohort. If, in any vaccine group and at any time point of the Epoch 001, the percentage of vaccinated subjects excluded from the primary ATP cohort for safety is more than 5%, a second analysis based on the primary ATP cohort for safety will be performed to complement the primary Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) or 31-day (Days 0-30) follow-up period will be tabulated after each vaccine dose and overall (for the Epoch 001) with exact 95% CI.
- The percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 4-day or 31-day follow-up period will be tabulated over the primary vaccination period, with exact 95% CI.

- The percentage of subjects/doses with local AEs (solicited and unsolicited) will be calculated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines, as well as overall (all sites considered) during the 4-day follow-up period will be tabulated over the primary vaccination period, with exact 95% CI..
- The percentage of subjects/doses reporting each individual solicited local and general AE during the 4-day follow-up period will be tabulated for each group as follows:
  - Over the primary doses, the percentage of subjects with the symptom and its exact 95% CI.
  - Over the primary doses, the percentage of doses with the symptom and its exact 95% CI.
  - At each study dose, the percentage of subjects with the symptom and its exact 95% CI.

  The exact 95% CIs will be calculated assuming independence between doses.
- All computations mentioned above will be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit. The percentage of subjects reporting each individual solicited local (any grade, grade 2, grade 3, medical advice) during the 4-day follow-up period will also be tabulated at each injection site for *Infanrix Hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines with exact 95% CI after each vaccine dose and overall where the same row on the table is used for all.vaccines given at the same site across the three study groups (e.g. *Infanrix Hexa*, *Pentacel* and *Pediarix* together are in one row and *ActHIB* and *Engerix-B* together are in one row).
- For fever, analyses will be performed by 0.5°C increments.
- The percentage of subjects/doses with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination will be tabulated after each dose and over the Epoch 001.
- The verbatim reports of unsolicited AEs will be reviewed by a Clinical Research and Development Lead and the signs and symptoms will be coded according to MedDRA. Every verbatim term will be matched with the appropriate Preferred Term. The percentage of subjects/doses with unsolicited AEs occurring within 31 days with exact 95% CI will be tabulated by Preferred Term. Similar tabulations will be done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.
- Subjects who experienced AEs of specific interest (i.e. convulsions, Hypotonic Hyporesponsive Episode) during 31 days with exact 95% CI will be tabulated by

Preferred Term. Similar tabulations will be done for AEs considered related to vaccination. Subjects who experienced AEs of specific interest will also be described in detail.

- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to 6 months after the last primary vaccination will be tabulated by Preferred Term.
- Subjects who experienced at least one SAE reported before the database lock for the Epoch 001 analysis with an onset date in the Epoch 001 will be reported and the SAE will be described in detail.

All the above safety and reactogenicity analysis for Epoch 001 will also be performed by gender and geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry) except the percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period.

6.2. Final analysis of the Epoch 002

6.2.1. Analysis of demographics/baseline characteristics

Demographic characteristics (age [months] at Visit 5, gender, geographical ancestry, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status will be summarized by group using descriptive statistics:

- Frequency tables will be generated for categorical variables such as race/ethnicity;
- Mean, median and standard error will be provided for continuous data such as age.

The distribution of subjects vaccinated at Visit 5 among the study sites will be tabulated as a whole and per group.

For enrolled subjects that do not participate in the Epoch 002, the reason for not participating will be summarized.

6.2.2. Analysis of immunogenicity

The primary analysis will be based on the booster ATP cohort for immunogenicity. An analysis on the booster Total Vaccinated cohort will be performed only if, in any vaccine group and at any time point of the Epoch 002, more than 5% of the vaccinated subjects with immunological data are excluded from the booster ATP cohort for immunogenicity.

The following section describes the analyses that will be performed.

6.2.2.1. Within group assessment

For each group, prior to the booster dose and one month post-booster dose and for each assay, for which a serological result is available:

- Seropositivity and seroprotection rates and booster response rates for pertussis with exact 95% CIs will be calculated.
- GMCs/GMTs with 95% CIs will be tabulated.
- For each antigen, antibody concentration or titer distribution before and one month Post-booster (when available) will be tabulated and displayed using RCCs.

All the above within group analysis for Epoch 002 except the reverse cumulative curves will also be performed by gender, by geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry), by Tdap vaccination history of mothers during pregnancy and Hepatitis B vaccination of the subjects at birth (for anti-HBs antigen).

6.2.2.2. Between group assessment

At pre-booster and at one month post-booster,

- The asymptotic standardized 95% CI for the group difference (Pedia group minus Hexa group and Penta group minus Hexa group) in the seroprotection/ seropositivity rates will be computed for each antigen except for group difference (Penta group minus Hexa group) in the seroprotection/ seropositivity rates for pertussis antigens.
- The 95% CI for each group GMC/GMT ratio (Pedia group divided by Hexa group and Penta group divided by Hexa group) will be computed using an ANOVA model on the logarithm-transformed concentrations/titers except for GMC ratio (Penta group divided by Hexa group) for pertussis antigens. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA). For hepatitis B antigen, the hepatitis B at birth vaccine dose status will also be used as regressor leading to an ANCOVA model. The model will include the data from the 2 groups compared.

6.2.2.3. Interpretation of analyses

In Epoch 002, all comparative analyses will be descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These

descriptive/exploratory analyses should not be interpreted for formal conclusions since there is no adjustment for multiplicity of endpoints.

6.2.3. Analysis of safety

The primary analysis for the Epoch 002 will be based on the booster Total Vaccinated cohort and will only look at the booster dose. If, in any vaccine group, the percentage of vaccinated subjects excluded from the booster ATP cohort for safety is more than 5%, a second analysis based on the booster ATP cohort for safety will be performed to complement the booster Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period after the booster dose, will be tabulated with exact 95% CI for each group.
- The incidence of local AEs (solicited and unsolicited) will be calculated at each injection site as well as overall (all sites considered) for each group during the 4-day (Days 0-3) follow-up period after the booster dose.
- The percentage of subjects reporting each individual solicited local and general AE during the 4-day follow-up period will be tabulated with its exact 95% CI for each group.
- All computations mentioned above will be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit. The percentage of subjects reporting each individual solicited local (any grade, grade 2, grade 3, medical advice) during the 4-day follow-up period will also be tabulated at each injection site for *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel* vaccines with exact 95% CI after each vaccine dose and overall where vaccine with same vaccine site is considered together (e.g. *Infanrix* and *Pentacel* together are on one row and *ActHIB* and *Hiberix* together are on one row).
- For fever, analyses will be performed by 0.5°C increments.
- The percentage of subjects with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination will be tabulated for each group.
- The verbatim reports of unsolicited AEs will be reviewed by a Clinical Research and Development Lead and the signs and symptoms will be coded according to MedDRA. Every verbatim term will be matched with the appropriate Preferred Term. The percentage of subjects with unsolicited AEs occurring within 31 days following the booster dose with its exact 95% CI will be tabulated by Preferred Term. Similar

tabulations will be done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.

Additionally,

- Any large injection site reaction (defined as a swelling with a diameter > 50 mm, noticeable diffuse swelling or increase in limb circumference of greater than 50 mm) reported within 4 days (Days 0-3) following the booster dose will be described in detail.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from booster dose up to one month after booster vaccination will be tabulated by Preferred Term.
- Subjects who experienced at least one SAE from the booster dose to study end will be reported and the SAEs will be described in detail.

All the above safety and reactogenicity analysis for Epoch 002 will also be performed by gender and geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestry, namely White Caucasian versus any other geographical ancestry) except percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period after the booster dose.

7. STATISTICAL CALCULATIONS

7.1. Derived and transformed data

7.1.1. Demography

For a given subject and a given demographic variable, missing measurement will not be replaced excepting for age.

Age will be calculated as the number of years between the date of birth and the date of vaccination.

To ensure that the collection of date of birth will not jeopardise the privacy of personally identifiable information, only a partial date of birth (MMYYYY) will be collected.

Therefore, the 15th of the month will be used to replace the missing date. In case the day and the months are missing, the date will be replaced by the June 30th of the year.

7.1.2. ImmunogenicityA seronegative subject is a subject whose antibody concentration/titer is below the assay cut-off.

- A seropositive subject is a subject whose antibody concentration/titer is greater than or equal to the assay cut-off defined in Table 7 of the protocol.

  Note: Due to ongoing re-validation of all assays, these cut-offs may be subject to change.

- A seroprotected subject is a subject whose antibody concentration/titer is greater than or equal to the level defining clinical protection. The following seroprotection thresholds are applicable:
  - Anti-diphtheria antibody concentrations ≥ 0.1 IU/mL.
  - Anti-tetanus antibody concentrations ≥ 0.1 IU/mL.
  - Anti-HBs antibody concentrations ≥ 10 mIU/mL.
  - Anti-poliovirus types 1, 2 and 3 antibody titers ≥ 8.
  - Anti-PRP antibody concentrations ≥ 0.15 µg/mL.
- Other cut-offs to be considered:
  - Anti-PRP antibody concentrations ≥ 1.0 µg/mL.
  - Anti-diphtheria and anti-tetanus antibody concentrations ≥ 1.0 IU/mL
- Booster responses for anti-PT, anti-FHA and anti-PRN antibodies are defined as:
  - initially seronegative subjects (pre-booster antibody concentration below cut-off: < 5 ELISA EL.U/mL) with an increase of at least four times the cut-off one month after vaccination (post-booster antibody concentration ≥20 EL.U/mL), and
  - initially seropositive subjects with pre-booster antibody concentration ≥ 5 EL.U./mL and < 20 EL.U/mL with an increase of at least four times the pre-booster antibody concentration one month after vaccination, and,
  - For initially seropositive subjects with pre-booster antibody concentration ≥ 20 EL.U/mL with an increase of at least two times the pre-booster antibody concentration, one month after vaccination.

  Note: Due to ongoing re-validation of pertussis assays, the definition of booster response may be subject to change.
- The GMC/GMT calculations will be performed by taking the anti-log of the mean of the $\log_{10}$ titer/ concentration transformations. Antibody titers/concentrations below the cut-off of the assay will be given an arbitrary value of half the cut-off for the purpose of GMC/GMT calculation.

- Handling of missing data - For a given subject and a given immunogenicity measurement, missing or non-evaluable measurements will not be replaced.

7.1.3. Safety/reactogenicity:

- For a given subject and the analysis of solicited symptom within 4 days post-vaccination, missing or non-evaluable measurements will not be replaced. Therefore the analysis of the solicited symptoms based on the Total Vaccinated cohort will include only vaccinated subjects and doses with documented safety data (i.e. symptom screen completed).
- For analysis of unsolicited adverse events, such as serious adverse events or adverse events by primary MedDRA term, and for the analysis of concomitant medications, all vaccinated subjects will be considered. Subjects who did not report the event or the concomitant medication will be considered as subjects without the event or the concomitant medication respectively.
- For analysis of convulsion, the adverse event will be identified by using narrow standard MedDRA query.
- For analysis of convulsion, the adverse event will be identified by using narrow standard MedDRA query.
- For analysis of Hypotonic Hyporesponsive Episode (HHE), the adverse event will be identified by using broad standard MedDRA query.
- For analysis of New Onset of Chronic Illness (NOCI), the adverse event will be identified by using narrow standard MedDRA query.
- For summaries reporting both solicited and unsolicited adverse events, all vaccinated subjects will be considered. Subjects for whom the event will not be reported will be considered as subjects without the event.
- Large injection site reactions are defined as either swelling with a diameter of >50 mm or a >50 mm increase in the circumference of any limb when compared to the baseline (pre-vaccination) measurement, or any diffuse swelling that interferes with or prevents everyday activities (for example, active playing, eating, sleeping).
- For the analysis, temperatures by any route will be coded as follows:

Grade	Temperature
0	< 38.0°C
1	≥ 38.0°C - ≤ 39.0°C
2	> 39.0°C - ≤ 40.0°C
3	> 40.0°C

- The way the percentage of subjects will be derived will depend on the event analysed (see table below for details). As a result, the N value will differ from one table to another.

Event	N used for deriving % per subject for Vaccination phase
Concomitant vaccination	All subjects with study vaccine administered
Solicited general symptom	All subjects with at least one solicited general symptom documented as either present or absent (i.e. symptom screen completed)
Solicited local symptom	All subjects with at least one solicited local symptom documented as either present or absent (i.e. symptom screen completed)
Unsolicited symptom	All subjects with study vaccine administered
Concomitant medication	All subjects with study vaccine administered

7.2. Data presentation description

The following decimal description from the decision rules will be used for the demography, immunogenicity and safety/ reactogenicity.

Display Table	Parameters	Number of decimal digits
Demographic characteristics	Mean, median age	1
Demographic characteristics	SD (age)	1
anti-T	GMC	3
anti-D	GMC	3
anti-PT	GMC	1
anti-PHA	GMC	1
anti-PRN	GMC	1
anti-HBs	GMC	1
anti-PRP	GMC	3
anti-Polio 1	GMT	1
anti-Polio 2	GMT	1
anti-Polio 3	GMT	1
Immunogenicity	Ratio of GMT/C	2
Reactogenicity	Mean, Min, Q1, Median, Q3, Max for duration	1
All summaries	% of count, including LL & UL of CI	1

All summaries	% of difference, including LL & UL of CI	2

7.3. Methodology for computing confidence intervals

- All CI computed will be two-sided 95% CI.
- The exact 95% CIs for a proportion within a group will be based on the method by Clopper [Clopper, 1934*].
- The standardised asymptotic 95% CI for the group difference in proportions will be based on the method 6 described in paper by Newcombe [R Newcombe, 1998, method six**].
- The 95% CI for geometric mean titres/concentrations (GMTs/GMCs) will be obtained within each group separately. The 95% CI for the mean of log-transformed titre/concentration will be first obtained assuming that log-transformed values were normally distributed with unknown variance. The 95% CI for the GMTs/GMCs will be then obtained by exponential-transformation of the 95% CI for the mean of log-transformed titre/concentration.

  The GMC/GMT group ratio will be computed using an ANOVA model on the logarithm10 transformation of the concentrations/titres. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B vaccination at birth vaccine dose status will also be used as regressor leading to an Analysis of Co-variance (ANCOVA) model.

8. CONDUCT OF ANALYSES

8.1. Sequence of analyses

The analyses will be performed stepwise:

1. ***A partial analysis of Epoch 001 up to one month after the third primary vaccine dose will be conducted. This analysis will include the final analysis of anti-PRP, solicited and unsolicited symptoms on data as clean as possible. This analysis will be displayed on GSK clinical trial registry as soon as possible.***
2. ***The final data analysis of the study covering both the epochs will be conducted at the end of the study. All these analyses will be presented in a final clinical study report.***

Following analysis folder will be created in SDD and CARS with given analysis ID to perform analysis and archival of statistical reports

Description	Analysis ID (SDD & CARS sub-folder)	Disclosure	TFL reference
Primary Epoch -Anti-PRP and safety	***E1_01***	***CTRS***	***From TFL Version 1 dated 10-Mar-2015, following tables will be generated for time point - one month post vaccination dose 3.*** • ***Post-Text table section – Table-29, 34, 35, 38, 39.*** • ***CTRS table sections – Table 1-5, 10, 12-15)*** • ***Annex table section – Table 3*** ***Please note that the tables from post text section will be generated with output destination 'ANNEX'.***
Final	***E1_02***	***CTRS, Clinical Study report, Publication***	***TFL***

8.2. Statistical considerations for interim analyses

All analyses will be conducted on final data and therefore no statistical adjustment for interim analyses is required.

9. MAJOR CHANGES FROM PLANNED ANALYSES

Following are the changed in the SAP from protocol:-

- The analysis of percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 31-day (Days 0-30) follow-up period will not be tabulated over the primary vaccination period and also over booster vaccination period, with exact 95% CI. Also the same analysis by gender and geographical ancestry will not be performed.

1. TABLES AND FIGURES

1.1. Study Population

Table 1 Study population Primary Epoch (Primary TVC)

Number of subjects	**Hexa group**	**Pedia group**	**Penta group**
Planned, N	195	195	195
Randomized, N (TVC)	195	194	196
Completed, n (%)	178 (91.3)	182 (93.8)	178 (90.8)
Demographics	**Hexa group**	**Pedia group**	**Penta group**
N (TVC)	195	194	196
Females: Males	101:94	80:114	95:101
Mean Age, weeks (SD)	8.5 (1.0)	8.6 (1.1)	8.6 (1.1)
Median Age, weeks (minimum, maximum)	8 (6, 12)	9 (6, 12)	8 (6, 12)
White-Caucasian / European Heritage, n (%)	118 (60.5)	128 (66.0)	115 (58.7)
Other, n (%)	29 (14.9)	27 (13.9)	32 (16.3)
American Indian or Alaskan Native, n (%)	15 (7.7)	15 (7.7)	17 (8.7)

Hexa group = Subjects who received three doses of *Infanrix Hexa* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Pedia group = Subjects who received *Pediarix*, *ActHIB* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Penta group = Subjects who received *Pentacel*, *Engerix* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
N = total number of subjects
n/% = number/percentage of subjects
SD = standard deviation

Table 2 Number of subjects vaccinated, completed and withdrawn with reasons of withdrawal up to Visit 4 (Primary TVC)

	Hexa group	Pedia group	Penta group	Total
Number of subjects vaccinated	195	194	196	585
Number of subjects completed	178	182	178	538
Number of subjects withdrawn	17	12	18	47
Reasons for withdrawal :				
Subject died	0	0	0	0
Serious Adverse Event	1	0	0	1
Non-Serious Adverse Event	0	0	1	1
Eligibility criteria not fulfilled (inclusion and exclusion criteria)	0	0	0	0
Protocol violation	1	0	4	5
Consent withdrawal (not due to an adverse event)	3	6	5	14
Migrated/moved from study area	2	3	0	5
Lost to follow-up (subjects with incomplete vaccination course)	2	0	2	4
Lost to follow-up (subjects with complete vaccination course)	4	0	0	4
Sponsor study termination	0	0	1	1
Other-loss of Kaiser insurance	0	0	1	1
Other-lost health plan	1	2	0	3
Other-lost health plan at Kaiser	0	1	0	1
Other-lost Kaiser insurance	1	0	0	1
Other-lost Kaiser permanente health insurance	0	0	1	1
Other-parent no show x3	1	0	0	1
Other-refuses blood draws	0	0	1	1
Other-subject was discontinued due to non-compliance	0	0	1	1
Other-terminated by pi due to non-compliance with appointment schedules	1	0	0	1
Other-travelling out of country and unable to meet visit window	0	0	1	1

Hexa group = Subjects who received three doses of *Infanrix Hexa* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Pedia group = Subjects who received *Pediarix*, *ActHIB* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Penta group = Subjects who received *Pentacel*, *Engerix* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Vaccinated = number of subjects who were vaccinated in the study
Vaccinated = number of subjects who were vaccinated in the study up to Visit 4
Completed = number of subjects who completed Visit 4
Withdrawn = number of subjects who did not come back for Visit 4

Table 3 Number of enrolled subjects by country

	Hexa group N = 195	Pedia group N = 194	Penta group N = 196	Total N = 585
Country	**n**	**n**	**n**	**n**
United States	195	194	196	585

Hexa group = Subjects who received three doses of *Infanrix Hexa* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Pedia group = Subjects who received *Pediarix*, *ActHIB* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Penta group = Subjects who received *Pentacel*, *Engerix* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
N = Number of enrolled subjects
n = number of enrolled subjects included in each group or in total for a given country or for all countries

Table 4 Number of enrolled subjects by age category

	Hexa group N = 195	Pedia group N = 194	Penta group N = 196	Total N = 585
Age category	**n**	**n**	**n**	**n**
Infants and toddlers (28 days-23 months)	195	194	196	585

Hexa group = Subjects who received three doses of *Infanrix Hexa* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Pedia group = Subjects who received *Pediarix*, *ActHIB* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Penta group = Subjects who received *Pentacel*, *Engerix* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
N = Number of enrolled subjects
n = number of enrolled subjects included in each group or in total for a given age category or for all age categories

Table 5 Number of subjects enrolled into the study as well as the number excluded from ATP analyses for Primary Epoch with reasons for exclusion excluded from ATP analyses with reasons for exclusion

	Total			Hexa group		Pedia group		Penta group	
Title	**n**	**s**	**%**	**n**	**s**	**n**	**s**	**n**	**s**

Hexa group = Subjects who received three doses of *Infanrix Hexa* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Pedia group = Subjects who received *Pediarix*, *ActHIB* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Penta group = Subjects who received *Pentacel*, *Engerix* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
For each dose and overall/subject:
N = number of subjects with at least one documented dose
n/% = number/percentage of subjects reporting the symptom at least once
For Overall/dose:

N = number of documented doses
n/% = number/percentage of doses followed by at least one type of symptom
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit
All = all reports of the specified symptom irrespective of intensity grade
Grade2*3=Grade 2 or Grade 3
Grade 2 For Pain: Moderate: Moderate: Cries/protests on touch
For Redness/Swelling: >5 mm but ≤ 20 mm
Grade 3 For Pain= Severe: Cries when limb is moved/spontaneously painful.
For Redness/Swelling: >20 mm

Table 10 Number (%) of subjects reporting solicited general symptoms during the 4-day (Days 0-3) post-vaccination period following each dose and overall (Primary TVC)

Hexa group = Subjects who received three doses of *Infanrix Hexa* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Pedia group = Subjects who received *Pediarix*, *ActHIB* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
Penta group = Subjects who received *Pentacel*, *Engerix* and *Prevnar* 13 at 2, 4 and 6 month of age and *Rotarix* at 2 and 4 months of age
For each dose and overall/subject:
N = number of subjects with at least one documented dose
n/% = number/percentage of subjects reporting the symptom at least once
For Overall/dose:
N = number of documented doses
n/% = number/percentage of doses followed by at least one type of symptom
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit
All = all reports of the specified symptom irrespective of intensity grade
Related = Symptoms which is assessed by the investigator as related to vaccination
Grade 3 For Drowsiness: Severe: Drowsiness that prevents normal activity
For Irritability: Severe: Crying that cannot be comforted/prevents normal activity
For Loss of appetite: Severe: Not eating at all
For Temperature: >40.0 °C

Table 11 Number (%) of subjects with adverse events reported during 31-day (Days 0-30) post-vaccination period (Primary TVC)

Annotated Study Book for Study Design: DTPA-HBV-IPV-135 (117119)

Study Design Version: 1.0

Sponsor: GlaxoSmithKline Vaccines

Protocol: DTPA-HBV-IPV-135 (117119)

Generic Drug Name: DTPA-HBV-IPV Vaccine

Trade Drug Name: Infanrix Hexa

A Phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa™ vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar® and Rotarix™ with a booster dose of GSK Biologicals' Infanrix® and Hiberix™ vaccines at 15-18 months of age.

DTPA-HBV-IPV-135 (117119): ELIGIBILITY CHECK (Eligibility) [frmELIGIBILITYCHECK]

ELIGIBILITY CHECK [sctELIGIBILITYCHECK]

1.* ✔	Did the subject meet all the entry criteria? [Eligible]	[*itmELIGIBIL* : **ELISHEET.ELIGIBIL**] ☐ Yes ☐ No -> Tick all boxes corresponding to violations of any inclusion/exclusion criteria. Do not enter the subject into the study if he/she failed any of the inclusion or exclusion criteria below. [*itmINCL_CRITERIA* : **ELIGIBIL.CRIT_NR**] **INCLUSION CRITERIA** Tick the boxes corresponding to any of the inclusion criteria the subject failed. ☐ 1.Subjects' parent(s)/Legally Acceptable Representative(s) [LAR(s)] who, in the opinion of the investigator, can and will comply with the requirements of the protocol (e.g. completion of the diary cards, return for follow-up visits). ☐ 2. A male or female between, and including, 6 and 12 weeks of age at the time of first vaccination. ☐ 3. Born full-term (i.e. after a gestation period of 37 weeks to less than 42 completed weeks [259 to 293 days]). ☐ 4. Written informed consent obtained from the parent(s)/LAR(s) of the subject ☐ 5. Healthy subjects as established by medical history and clinical examination before entering into the study. ☐ 6. Infants who have not received a previous dose of hepatitis B vaccine or those who have received only 1 dose of hepatitis B vaccine administered at least 30 days prior to enrolment. [*itmEXCL_CRITERIA* : **ELIGIBIL.CRIT_NR**] **EXCLUSION CRITERIA** Tick the boxes corresponding to any of the exclusion criteria that disqualified the subject from entry. ☐ 7. Child in care ☐ 8. Use of any investigational or non-registered product (drug or vaccine) other than the study vaccines within 30 days preceding the first dose of study vaccines, or planned use during the study period ☐ 9. Chronic administration (defined as more than 14 days in total) of immunosupp. or other immune-modifying drugs since birth. (For corticosteroids, this will mean prednisone > or = 0.5 mg/kg/day, or equivalent). Inhaled and topical steroids are allowed. ☐ 10. Planed adm/adm of vac not forseen by prot 30d before dose1 till 30d after dose3 & 30d before/after booster. Inactiv. flu & HepA vac allowed. Rout.admin. of MMR, varicella, pneumo vac allowed 30d after last pri vacc till 30d before Bst&post-bst samplng ☐ 11. Concurrently participating in another clinical study, at any time during the study period, in which the subject has been or will be exposed to an investigational or a non-investigational product (pharmaceutical product or device). ☐ 12. History of Hib, diphtheria, tetanus, pertussis, pneumococcal, rotavirus, poliovirus and hepatitis B diseases. ☐ 13. Previous vaccination against Hib, diphtheria, tetanus, pertussis, pneumococcus, rotavirus and/or poliovirus; more than one previous dose of hepatitis B vaccine. ☐ 14. Any confirmed or suspected immunosuppressive or immunodeficient condition, based on medical history and physical examination (no laboratory testing required). ☐ 15. Family history of congenital or hereditary immunodeficiency. ☐ 16. History of any reaction or hypersensitivity likely to be exacerbated by any component of the vaccines (including yeast). ☐ 17. Hypersensitivity to latex. ☐ 18. Major congenital defects or serious chronic illness. ☐ 19. History of any neurological disorders including seizures. ☐ 20. Administration of immunoglobulins and/or any blood products since birth or planned administration during the study period. ☐ 21. History of intussusception or of any uncorrected congenital malformation of the gastrointestinal tract that would predispose the infant to intussusception. ☐ 22. History of Severe Combined Immunodeficiency Disease (SCID). ☐ 23. Acute disease and/or fever at time of enrol.– Fever: temp>or=38.0°C /100.4°F by any rout. Pref route: rectal for pri & axilary for bst. Sub. with minor illnes (eg: mild diar, mild uper resp.infection) with no fever may be enrol. at discretion of INV

DTPA-HBV-IPV-135 (117119): SERIOUS ADVERSE EVENTS (SAE) - Repeating Form [AE_SER_CR]

#	SAE Report No.	Did SAE occur after initiation of study medication?	SERIOUS ADVERSE EVENT	Seriousness	RELEVANT CONCOMITANT/TREATMENT MEDICATIONS/VACCINATIONS	RELEVANT MEDICAL CONDITIONS/RISK FACTORS	RELEVANT DIAGNOSTIC RESULTS	Relevant diagnostic results not noted on the left columns	General narrative comments
1									

If you wish to record a new SAE please determine if the new SAE is clinically or temporally related to an SAE previously entered on this form.
If yes, record the details below using the 'Add Entry' button in this form.
If not clinically or temporally related, create a new SAE form for this subject by clicking on the 'New' button at the top of the page.
Do not record pre and post randomization events on the same form.

SAE REPORT NO. [sctSAE_REPORT_NO]

1. ✔	SAE Report No. *[read-only]* [SAE Report No.]	[*itmSAE_NB* : SAE.SAE_NB] N2
2.	Start date of SAE (minimum date from sctSAE) *[hidden]* [Start date if SAE (minimum date from sctSAE)]	[*itmSAE_STRT* : Not submitted - for internal use] NReq / NReq / NReq (2013-2018)
3.	Stop date of SAE (maximum date from sctSAE) *[hidden]* [Stop date of SAE (maximum date from sctSAE)]	[*itmSAE_STOP* : Not submitted - for internal use] NReq / NReq / NReq (2013-2018)

RELEVANT MEDICAL CONDITIONS/RISK FACTORS Entry [sctSAE_MHX]

Use the 'Add Entry' button to enter each past or current medical disorder, allergy or surgery that may be RELEVANT to the SAE. Enter a diagnosis, not description. Relevant family or social history shoud be described in the 'General Narrative Comments' at the bottom of this form. Ensure each medical condition/risk factor recorded in this section is also recorded in the General Medical History form located at the beginning of the eCRF.

GENERAL NARRATIVE COMMENTS [sctSAE_COM]

Provide a clear (this narrative will be provided to regulatory authorities) and brief chronological description (with dates) of the clinical course of the event including:
- Associated signs and symptoms
- Clinical evolution (hospitalisation, outcome, description of sequelae if any, autopsy results, etc.)
- Non-drug treatment such as surgery
- Other information useful for the medical assessment of the case (e.g. reason for diagnosis if not obvious or if diagnosis changed)
- Relevant additional risk factors including family or social history (negative sentence can also be helpful)
- Possible cause(s) of the event
- Rationale for relationship when SAE is possibly related to study product, concomitant product or study procedure, etc.

Complete a new box only when the previous one is full.

Protocol Amendment 2 Rationale

Amendment number: Amendment 2
Rationale/background for changes: The amendment 2 has been implemented to amend the following sections of the protocol: • The assay for testing antibodies against polyribosyl ribitol phosphate (anti-PRP) has been re-developed but is not yet qualified or validated for testing the one month post dose-3 samples. This has been clarified in the protocol in Table 7 Humoral immunity (antibody determination) and Section 5.7.3 Laboratory assays. • Investigator sign-off on the patient identification (PIDS) will be done after Visit 4 instead of extended safety follow-up (ESFU). In Table 4 List of study procedures, the bullets pertaining to investigator sign-off and analysis of Epoch 001 has been removed from the ESFU visit and retained at Visit 4 to reflect this change. • The collection of baseline measurement of limb length has been removed since it will not be used in analysis; only limb circumference will be used in analysis. Accordingly, text related to this has been amended in Table 4 List of study procedures, Sections 5.6.2.11, Baseline measurement of limb circumference after booster vaccination at visit 5 and 5.6.2.13 Recording of AEs, SAEs and NOCDs. • Errors in the vaccines dictionary of Study Master Repository (SMR) have been rectified for *Infanrix hexa*, *Pediarix* and *Pentacel* vaccines. The corresponding correction has been made in Table 9 Study vaccines. • The sequence of analysis in Section 10.9.1 Sequence of analyses, has been amended to reflect that there will first be an analysis of immunogencity for anti-PRP and safety for Epoch 001, followed by a final analysis covering both Epochs at the end of the study.

Protocol Amendment 2 Investigator Agreement

I agree:

- To conduct the study in compliance with this protocol, any future protocol amendments or protocol administrative changes, with the terms of the clinical trial agreement and with any other study conduct procedures and/or study conduct documents provided by GlaxoSmithKline (GSK) Biologicals.
- To assume responsibility for the proper conduct of the study at this site.
- That I am aware of, and will comply with, 'Good Clinical Practice' (GCP) and all applicable regulatory requirements.
- To ensure that all persons assisting me with the study are adequately informed about the GSK Biologicals' investigational vaccine and other study-related duties and functions as described in the protocol.
- To acquire the reference ranges for laboratory tests performed locally and, if required by local regulations, obtain the laboratory's current certification or Quality Assurance procedure manual.
- To ensure that no clinical samples (including serum samples) are retained onsite or elsewhere without the approval of GSK Biologicals and the express written informed consent of the subject and/or the subject's legally acceptable representative.
- To perform no other biological assays on the clinical samples except those described in the protocol or its amendment(s).
- To co-operate with a representative of GSK Biologicals in the monitoring process of the study and in resolution of queries about the data.
- That I have been informed that certain regulatory authorities require the sponsor to obtain and supply, as necessary, details about the investigator's ownership interest in the sponsor or the investigational vaccine, and more generally about his/her financial ties with the sponsor. GSK Biologicals will use and disclose the information solely for the purpose of complying with regulatory requirements.

Hence I:

- Agree to supply GSK Biologicals with any necessary information regarding ownership interest and financial ties (including those of my spouse and dependent children).
- Agree to promptly update this information if any relevant changes occur during the course of the study and for one year following completion of the study.
- Agree that GSK Biologicals may disclose any information it has about such ownership interests and financial ties to regulatory authorities.
- Agree to provide GSK Biologicals with an updated Curriculum Vitae and other documents required by regulatory agencies for this study.

SYNOPSIS

Detailed Title

A Phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa™ vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar® and Rotarix™ with a booster dose of GSK Biologicals' Infanrix® and Hiberix™ vaccines at 15-18 months of age.

Indication

Active immunization against diphtheria, tetanus, pertussis infection caused by all known subtypes of hepatitis B virus, poliomyelitis, and invasive disease caused by *Haemophilus influenzae* type B (Hib) in infants.

Rationale for the study and study design

- **Rationale for the study**

Infanrix hexa was first licensed in the European Union in 2000. More than 100 million doses have been distributed to date and the benefit/risk profile remains favorable. Licensure of *Infanrix hexa* combination vaccine in the United States (US) will provide an additional option for vaccination within the routine US pediatric schedule with the fewest number of injections, which would create opportunities to add further injections in case other novel vaccines against important pediatric diseases become available. Furthermore, *Infanrix hexa* will provide an additional source of DTaP, hepatitis B, poliovirus, and Hib-containing vaccine to the US market, which will help ensure a more stable supply.

The present study 117119 (DTPA-HBV-IPV-135) is intended to generate pivotal immunogenicity data demonstrating non-inferiority of the immune responses against pertussis antigens of *Infanrix hexa* compared to *Pediarix,* which is currently one of the DTaP combination vaccines widely used as a standard of care in the US. Additionally, this study will also provide descriptive data with regard to the immunogenicity of the other vaccine antigens and the safety profile in US subjects. These pivotal immunogenicity non-inferiority data for pertussis and descriptive safety data are intended to support the registration of GSK Biologicals' combined DTPa-HBV-IPV/Hib (*Infanrix hexa*) vaccine in the US. A subsequent Phase III study is planned to provide pivotal data regarding lot-to-lot consistency, safety and the immunogenicity of the other vaccine antigens.

Comparison of immunogenicity data from separate clinical studies for *Infanrix hexa* and *Pentacel*, given on a 2-4-6 month schedule, suggests that the immune response to the Hib

component of these vaccines is similar. This study will provide descriptive information regarding the immune response to the Hib components of *Infanrix hexa* and *Pentacel* following a 3 dose primary series, prior to further evaluation in Phase III studies.

- **Rationale for the study design**

Design of Epoch 001 (primary vaccination):

The study is designed as a randomized, controlled, open-label study with five parallel groups:

- The first three groups (Hexa_1, Hexa_2 and Hexa_3 group) will receive three doses of the *Infanrix hexa* vaccine (either lot A, lot B or lot C, respectively). These three groups will be pooled together for the analyses and the pooled group will be called the Hexa group.
- The Pedia Group (Control 1) will receive three doses of the US-licensed control vaccines, *Pediarix* and *ActHIB*.
- The Penta Group (Control 2) will receive three doses of the US-licensed control vaccines, *Pentacel* (only two doses of *Engerix-B* will be administered if a subject has received a birth dose of hepatitis B vaccine).

Three distinct vaccine lots manufactured according to the same procedures will be used in the Hexa group in order to obtain more representative data for the vaccine.

The study will be open-label due to the differences in the number of injections and the appearance of the vaccines administered.

Vaccines (i.e., *Prevnar13* and *Rotarix*) that are recommended for children in the US during the first year of life will be administered concomitantly with the other study vaccines as part of the study.

Design of Epoch 002 (booster vaccination):

In Epoch 002, the subjects will be assessed for antibody persistence to the vaccine antigens of *Infanrix hexa*. This epoch will also assess the adequacy of priming subjects with *Infanrix hexa* by evaluating the boostability of D, T, Pa and Hib antigens with the US-licensed vaccines. The pooled Hexa Group will receive booster doses of *Infanrix* and *Hiberix* vaccines at 15 through 18 months of age, the subjects in the Penta Group will receive *Pentacel* vaccine as a booster, and

the subjects in the Pedia Group will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15 through 18 months of age.

The study will continue to be open-label in Epoch 002.

Objectives

Primary

Epoch 001 (primary vaccination)

- To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens [pertussis toxoid (PT), filamentous hemagglutinin (FHA) and pertactin (PRN)] one month after the third dose of the primary vaccination.

  Criteria for non-inferiority:

  Non-inferiority in terms of immune response to pertussis antigens will be demonstrated if, for each of the three antigens, the upper limit of the 95% confidence interval (CI) on the GMC ratio [Pedia divided by Hexa] is ≤ 1.5.

Secondary

Epoch 001 (Primary vaccination)

- To assess the immune response to *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to D, T, HBs, pertussis, poliovirus types 1, 2 and 3 and PRP antigens, one month after the third dose of the primary vaccination.
- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa,* of *Pentacel* co-administered with *Engerix-B,* and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events, new-onset chronic diseases (NOCDs) and serious adverse events.

Epoch 002 (Booster vaccination)

- To assess the immunogenicity of *Infanrix hexa, Pentacel, Engerix-B, Pediarix* and *ActHIB,* in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.

- To assess the immune response to *Infanrix, Hiberix, ActHIB* and *Pentacel,* in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix and Pentacel*, one month after the booster dose.
- To assess the safety and reactogenicity of booster doses of *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*.

Study design

- Experimental design: Phase III, open-label, randomized, controlled, multi-centric, single-country study with five parallel groups.
- Duration of the study: The intended duration of the study per subject is approximately 14-17 months.
  - **Epoch 001**: Primary, starting at Visit 1 (Day 0) and ending at safety follow up contact (i.e. six months following the third dose, Month 10),
  - **Epoch 002**: Booster, starting at Visit 5 (Month 13-16) and ending at Visit 6 (Month 14-17).
- Study groups: The study groups are presented in Synopsis Table 1.

Synopsis Table 1 Study groups and epochs foreseen in the study

Study groups	Number of subjects	Age (Min/Max) at Visit 1	Epochs	
			Epoch 001	Epoch 002
Hexa_1	65	6 WEEK -12weeks	x	x

* *Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group.

- Control: active controls.
  - Epoch 001: *Pediarix* + *ActHIB* and *Pentacel* + *Engerix-B*
  - Epoch 002: *Infanrix* + *ActHIB* and *Pentacel*
- Vaccination schedules:

  <u>*Epoch 001*</u>
  - **Hexa Group:** Subjects in this group will receive three doses of *Infanrix hexa* (lot A, lot B or lot C as per the group allocation) co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
    - Hexa_1 Group: Subjects will receive lot A of *Infanrix hexa,*
    - Hexa_2 Group: Subjects will receive lot B of *Infanrix hexa*
    - Hexa_3 Group: Subjects will receive lot C of *Infanrix hexa*.

- **Pedia Group:** Subjects in this group will receive three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
- **Penta Group**: Subjects in this group will receive three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

*Subjects in the Penta Group who have received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination should not receive *Engerix-B* at 4 months of age (Visit 2).

Epoch 002

- **Hexa Group**: Subjects will receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.
- **Pedia Group**: Subjects will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.
- **Penta Group**: Subjects will receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

The fourth dose of pneumococcal conjugate vaccine is recommended to be administered at approximately 12-15 months of age. Since the booster dose of the candidate vaccine/active controls will be given in this study at 15-18 months of age, the fourth dose of *Prevnar13* will not be administered as part of the study protocol. Subject's parent(s)/Legally Acceptable Representative(s) (LARs) will be reminded at Visit 3 and Visit 4 to consult their primary health care provider regarding the fourth dose of *Prevnar13* at 12-15 months for their child.

As the analyses will be performed regardless of the lot of *Infanrix hexa* received, unless otherwise specified, the Hexa_1, Hexa_2 and Hexa_3 groups will be pooled together for the analysis and will be called the Hexa group.

- Treatment allocation: The subjects will be randomized at a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. This will be done at study entry using GSK Biologicals' central randomization system on internet (SBIR).
- Blinding: The study is open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered. However, the

laboratory in charge of the serology testing will be blinded to the treatment, and codes will be used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

The blinding of study epochs is presented in Synopsis Table 3.

Synopsis Table 3 Blinding of study epochs

Study Epochs	Blinding
Epoch 001	open
Epoch 002	open

- Sampling schedule: Blood samples will be drawn from all subjects at the following time points:
  - Post-Pri (Visit 4): One month after the third dose of primary vaccination, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Pre-Bst (Visit 5): Before the administration of the booster dose, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Post-Bst (Visit 6): One month after the booster vaccination, a volume of at least 3.5 mL of whole blood (to provide at least 1.2 mL of serum) will be collected.
- Type of study: self-contained.
- Data collection: electronic Case Report Form (eCRF).

Number of subjects The total number of subjects planned to be enrolled is 585 subjects (65 each in Hexa_1, Hexa_2, Hexa_3 groups and 195 each in Pedia and Penta groups).

Endpoints

Primary

Epoch 001 (Primary vaccination)

- Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix*.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.

Secondary

Epoch 001 (Primary vaccination)

- Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa, Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*.
  - Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3 and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after each vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after each vaccination, according to the **Med**ical **D**ictionary for **R**egulatory **A**ctivities (MedDRA) classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.

- Serious adverse events.
  - Occurrence of serious adverse events from Day 0 up to six months post primary vaccination.

Epoch 002 (Booster vaccination)

- Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Infanrix*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix*.
  - Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4).

- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after booster vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after booster vaccination, according to the MedDRA classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from the booster dose up to one month after the booster vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from the booster dose up to one month after the booster vaccination.

GLOSSARY OF TERMS

Adverse event:	Any untoward medical occurrence in a patient or clinical investigation subject, temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product. An adverse event (AE) can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a medicinal product. For marketed medicinal products, this also includes failure to produce expected benefits (i.e. lack of efficacy), abuse or misuse.
Blinding:	A procedure in which one or more parties to the trial are kept unaware of the treatment assignment in order to reduce the risk of biased study outcomes. The level of blinding is maintained throughout the conduct of the trial, and only when the data are cleaned to an acceptable level of quality will appropriate personnel be unblinded or when required in case of a serious adverse event. In an open-label study, no blind is used. Both the investigator and the subject know the identity of the treatment assigned.
Child in care:	A child who has been placed under the control or protection of an agency, organization, institution or entity by the courts, the government or a government body, acting in accordance with powers conferred on them by law or regulation. The definition of a child in care can include a child cared for by foster parents or living in a care home or institution, provided that the arrangement falls within the definition above. The definition of a child in care does not include a child who is adopted or has an appointed legal guardian.
Eligible:	Qualified for enrolment into the study based upon strict adherence to inclusion/exclusion criteria.
Epoch:	An epoch is a self-contained set of consecutive timepoints or a single timepoint from a single protocol. Self-contained means that data collected for all subjects at all timepoints within that epoch allows to draw a complete conclusion to define or precise the targeted label of the product. Typical examples of epochs are primary vaccinations, boosters, yearly immunogenicity follow-ups, and surveillance periods for efficacy or safety.

eTrack:	GSK's tracking tool for clinical trials.
Evaluable:	Meeting all eligibility criteria, complying with the procedures defined in the protocol, and, therefore, included in the according-to-protocol (ATP) analysis (see Sections 6.7.2 and 10.4 for details on criteria for evaluability).
Immunological correlate of protection:	The defined humoral antibody response above which there is a high likelihood of protection in the absence of any host factors that might increase susceptibility to the infectious agent.
Intercurrent medical condition:	A condition that has the capability of altering a subject's immune response or are confirmed to have an immunodeficiency condition during the study.
Investigational vaccine/product: **(Synonym of Investigational Medicinal Product)**	A pharmaceutical form of an active ingredient or placebo being tested or used as a reference in a clinical trial, including a product with a marketing authorization when used in a way different from the approved form, or when used for an unapproved indication, or when used to gain further information about an approved use.
Primary completion date:	The date that the final subject was examined or received an intervention for the purpose of final collection of data for the primary outcome, whether the clinical trial concluded according to the pre-specified protocol or was terminated.
Randomization:	Process of random attribution of treatment to subjects in order to reduce bias of selection.
Self-contained study:	Study with objectives not linked to the data of another study.
Site Monitor:	An individual assigned by the sponsor who is responsible for assuring proper conduct of clinical studies at one or more investigational sites.
Solicited adverse event:	AEs to be recorded as endpoints in the clinical study. The presence/occurrence/intensity of these events is actively solicited from the subject or an observer during a specified post-vaccination follow-up period.

Subject:	Term used throughout the protocol to denote an individual who has been contacted in order to participate or participates in the clinical study, either as a recipient of the vaccines or as a control.
Subject number:	A unique number identifying a subject, assigned to each subject consenting to participate in the study.
Treatment:	Term used throughout the clinical study to denote a set of investigational product(s) or marketed product(s) or placebo intended to be administered to a subject, identified by a unique number, according to the study randomization or treatment allocation.
Treatment number:	A number identifying a treatment to a subject, according to the study randomization or treatment allocation.
Unsolicited adverse event:	Any AE reported in addition to those solicited during the clinical study. Also any 'solicited' symptom with onset outside the specified period of follow-up for solicited symptoms will be reported as an unsolicited adverse event.

TRADEMARKS

The following trademarks are used in the present protocol.

In the body of the protocol (including the synopsis), the names of the vaccines will be written without the superscript symbol ™ or ® and in *italics*.

Trademarks of the GlaxoSmithKline group of companies	Generic description
Engerix-B®	Hepatitis B vaccine (recombinant)
Hiberix™	*Haemophilus* b conjugate vaccine (tetanus toxoid conjugate)
Infanrix®	Diphtheria and Tetanus Toxoids and Acellular Pertussis Vaccine Adsorbed
Infanrix hexa™	Combined Diphtheria-Tetanus-acellular Pertussis (DTaP), Hepatitis B, Poliovirus and *Haemophilus influenzae* type b vaccine
Pediarix®	Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed, Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine
Rotarix®	Rotavirus Vaccine, Live, Oral

Trademarks not owned by the GlaxoSmithKline group of companies	**Generic description**
ActHIB® **(Sanofi Pasteur SA)**	*Haemophilus* type b conjugate vaccine (tetanus toxoid conjugate)
Pentacel® **(Sanofi Pasteur SA)**	Diphtheria and tetanus toxoids and acellular pertussis adsorbed, inactivated poliovirus and *Haemophilus* b conjugate (tetanus toxoid conjugate)
Prevnar® **(Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.)**	Pneumoccocal 7-valent conjugate vaccine (diphtheria CRM_{197} protein)
Prevnar13® **(Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.)**	Pneumoccocal 13-valent conjugate vaccine (diphtheria CRM_{197} protein)

1. INTRODUCTION

1.1. Background

Combination vaccines have been developed to provide multiple immunizations in a single injection. They can simplify vaccine administration and have the potential to promote compliance and cost-effectiveness by decreasing the number of injections needed to immunize a child [Zinke, 2010; Kalies, 2006]. Use of combination vaccines can alleviate concerns associated with the number of injections to be given at one time [ACIP, 2011].

GlaxoSmithKline (GSK) Biologicals' *Infanrix hexa* vaccine helps prevent six diseases in a single injection. *Infanrix hexa* is licensed for primary and booster vaccination in more than 98 countries around the globe, including the entire European Union. The vaccine complies with the WHO requirements for manufacture of biological substances for all of its antigenic components. The *Infanrix hexa* vaccine consists of a combination of GSK's *Pediarix* (Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed, Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine Combined); STN 103907, approved in the United States (US) on December 13, 2002 and a Hib vaccine consisting of purified polyribosyl-ribitol-phosphate (PRP) capsular polysaccharide of *Haemophilus influenzae* type b covalently bound to tetanus toxoid (TT). The conjugated Hib-TT is the same as that used for the formulation of *Hiberix* [*Haemophilus* b Conjugate Vaccine (Tetanus Toxoid Conjugate)] (licensed in the US as a booster dose in August 2009), with the only difference that in *Infanrix hexa*, the Hib-conjugate is adsorbed onto aluminum phosphate.

The *Infanrix hexa* combination vaccine would provide an additional source of DTaP, hepatitis B, poliovirus, and Hib containing vaccines for the US market and would potentially reduce the number of injections required to provide infants with recommended vaccinations.

GSK has an extensive clinical safety database for *Infanrix hexa*. The safety and immunogenicity data of the vaccine have been evaluated in numerous controlled studies [Dhillon, 2010; Zepp, 2009], of which 4 were conducted in the US with approximately 3000 US subjects exposed to a primary vaccination with *Infanrix hexa*.

Please refer to the current Investigator Brochure for information regarding the pre-clinical and clinical studies and the potential risks and benefits of *Infanrix hexa*.

1.2. Rationale for the study and study design

1.2.1. Rationale for the study

Infanrix hexa was first licensed in the European Union in 2000. More than 100 million doses have been distributed to date and the benefit/risk profile remains favorable. Licensure of *Infanrix hexa* combination vaccine in the US will provide an additional option for vaccination within the routine US pediatric schedule with the fewest number of injections, which would create opportunities to add further injections in case other novel vaccines against important pediatric diseases become available. Furthermore, *Infanrix hexa* will provide an additional source of DTaP, hepatitis B, poliovirus, and Hib-containing vaccine to the US market, which will help ensure a more stable supply.

The present study 117119 (DTPA-HBV-IPV-135) is intended to generate pivotal immunogenicity data demonstrating non-inferiority of the immune responses against pertussis antigens of *Infanrix hexa* compared to *Pediarix,* which is currently one of the DTaP combination vaccines widely used as a standard of care in the US. Additionally, this study will also provide descriptive data with regard to the immunogenicity of the other vaccine antigens and the safety profile in US subjects. These pivotal immunogenicity non-inferiority data for pertussis and descriptive safety data are intended to support the registration of GSK Biologicals' combined DTPa-HBV-IPV/Hib (*Infanrix hexa*) vaccine in the US. A subsequent Phase III study is planned to provide pivotal data regarding lot-to-lot consistency, safety and the immunogenicity of the other vaccine antigens.

Comparison of immunogenicity data from separate clinical studies for *Infanrix hexa* and *Pentacel*, given on a 2-4-6 month schedule, suggests that the immune response to the Hib component of these vaccines is similar. This study will provide descriptive information regarding the immune response to the Hib components of *Infanrix hexa* and *Pentacel* following a 3-dose primary series, prior to further evaluation in Phase III studies.

1.2.2. Rationale for the study design

1.2.2.1. Design of Epoch 001 (primary vaccination):

The study is designed as a randomized, controlled, open-label study with five parallel groups:

- The first three groups (Hexa_1, Hexa_2 and Hexa_3 group) will receive three doses of the *Infanrix hexa* vaccine (either lot A, lot B or lot C, respectively). These three groups will be pooled together for the analyses and the pooled group will be called the Hexa group.
- The Pedia Group (Control 1) will receive three doses of the US-licensed control vaccines, *Pediarix* and *ActHIB*.
- The Penta Group (Control 2) will receive three doses of the US-licensed control vaccines, *Pentacel* (only two doses of *Engerix-B* will be administered if a subject has received a birth dose of hepatitis B vaccine).

Three distinct vaccine lots manufactured according to the same procedures will be used in the Hexa group in order to obtain more representative data for the vaccine.

The study will be open-label due to the differences in the number of injections and the appearance of the vaccines administered.

Vaccines (i.e., *Prevnar13* and *Rotarix*) that are recommended for children in the US during the first year of life will be administered concomitantly with the other study vaccines as part of the study.

1.2.2.2. Design of Epoch 002 (booster vaccination):

In Epoch 002, the subjects will be assessed for antibody persistence to the vaccine antigens of *Infanrix hexa*. This epoch will also assess the adequacy of priming subjects with *Infanrix hexa* by evaluating the boostability of D, T, Pa and Hib antigens with the US-licensed vaccines. The pooled Hexa Group will receive booster doses of *Infanrix* and *Hiberix* vaccines at 15 through 18 months of age, the subjects in the Penta Group will receive *Pentacel* vaccine as a booster, and the subjects in the Pedia Group will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15 through 18 months of age.

The study will continue to be open-label in Epoch 002.

2. OBJECTIVES

2.1. Primary objective

2.1.1. Epoch 001 (Primary vaccination)

- To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens [pertussis toxoid (PT), filamentous hemagglutinin (FHA) and pertactin (PRN)] one month after the third dose of the primary vaccination.

  Criteria for non-inferiority:

  Non-inferiority in terms of immune response to pertussis antigens will be demonstrated if, for each of the three antigens, the upper limit of the 95% confidence interval (CI) on the GMC ratio [Pedia divided by Hexa] is ≤ 1.5.

Refer to Section 10.1 for the definition of the primary endpoint.

2.2. Secondary objectives

2.2.1. Epoch 001 (Primary vaccination)

- To assess the immune response to *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to D, T, HBs, pertussis, poliovirus types 1, 2 and 3 and PRP antigens, one month after the third dose of the primary vaccination.

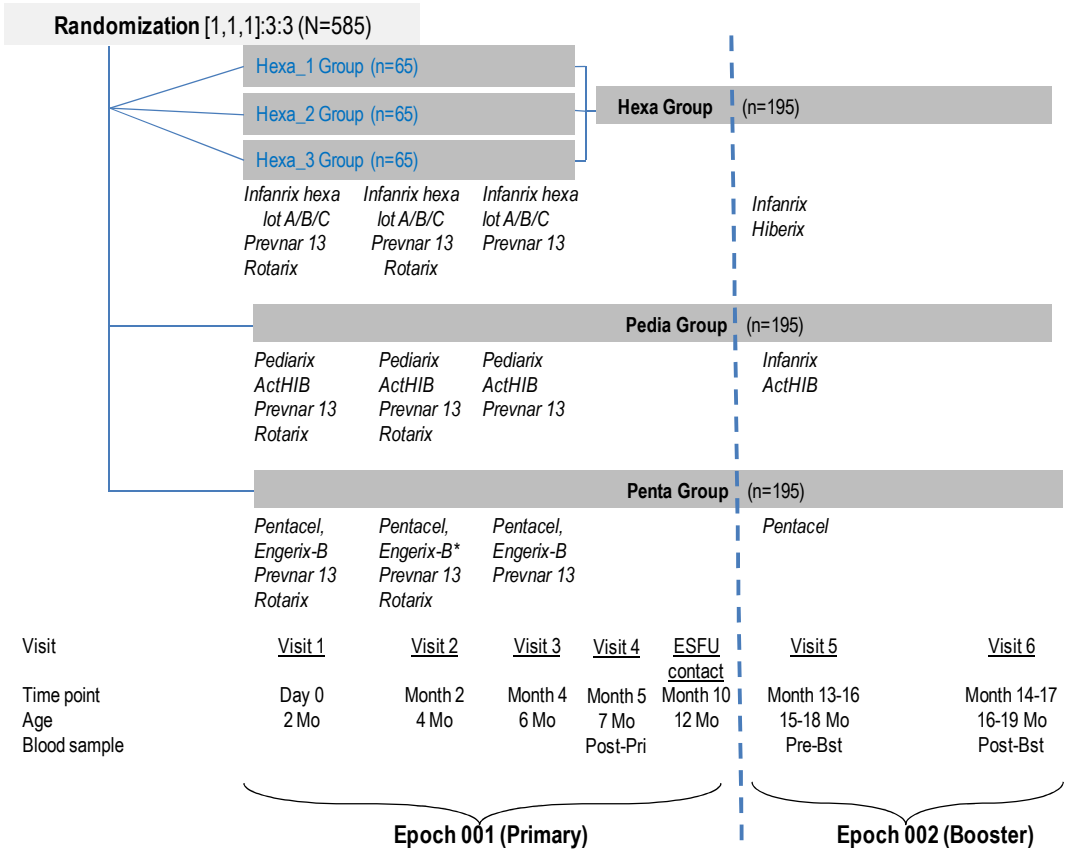
- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa,* of *Pentacel* co-administered with *Engerix-B,* and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events, new-onset chronic diseases (NOCDs) and serious adverse events.

2.2.2. Epoch 002 (Booster vaccination)

- To assess the immunogenicity of *Infanrix hexa, Pentacel, Engerix-B, Pediarix* and *ActHIB,* in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.
- To assess the immune response to *Infanrix, Hiberix, ActHIB* and *Pentacel,* in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix and Pentacel*, one month after the booster dose.
- To assess the safety and reactogenicity of booster doses of *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*.

Refer to Section 10.2 for the definition of the secondary endpoints.

3. STUDY DESIGN OVERVIEW



N = number of subjects in the study; n = number of subjects in each group; Mo = months
Visit 3 should be conducted at least 8 weeks after Visit 2, with subjects at least 24 weeks of age, in order to comply with US recommendations on hepatitis B dosing
Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002
* *Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group
ESFU = Extended safety follow-up

Protocol waivers or exemptions are not allowed with the exception of immediate safety concerns. Therefore, adherence to the study design requirements, including those specified in the outline of study procedures (Section 5.5), are essential and required for study conduct.

- Experimental design: Phase III, open-label, randomized, controlled, multi-centric, single-country study with five parallel groups.
- Duration of the study: The intended duration of the study per subject is approximately 14-17 months.
  - **Epoch 001:** Primary, starting at Visit 1 (Day 0) and ending at safety follow up contact (i.e. six months following the third dose, Month 10),

– **Epoch 002:** Booster, starting at Visit 5 (Month 13-16) and ending at Visit 6 (Month 14-17).

- Study groups: The study groups and epochs foreseen in the study are presented in Table 1.

Table 1 Study groups and epochs foreseen in the study

Study groups	Number of subjects	Age (Min/Max) at Visit 1	Epochs	
			Epoch 001	Epoch 002
Hexa_1	65	6 WEEK -12weeks	x	x
Hexa_2	65	6 WEEK -12weeks	x	x
Hexa_3	65	6 WEEK -12weeks	x	x
Pedia	195	6 WEEK -12weeks	x	x
Penta	195	6 WEEK -12weeks	x	x

The study groups and treatment foreseen in the study are presented in Table 2.

Table 2 Study groups and treatment foreseen in the study

Treatment name	Vaccine/Product name	Study Groups				
		Hexa_1	Hexa_2	Hexa_3	Pedia	Penta
Epoch 001						
Infanrix hexa		x	x	x		
	Hib					
Pediarix					x	
ActHIB	ActHIB				x	
	NaCl					
Pentacel	DTaP-IPV (Sanofi Pasteur)					x
	ActHIB					
Engerix-B*	HBV					x
Prevnar13	Prevenar 13	x	x	x	x	x
Rotarix	HRV	x	x	x	x	x
	$CaCO_3$					
Epoch 002						
Infanrix	DTPa	x	x	x	x	
Hiberix	Hib	x	x	x		
	NaCl					
ActHIB	ActHIB				x	
	NaCl					
Pentacel	DTaP-IPV (Sanofi Pasteur)					x
	ActHIB					

* *Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group.

- Control: active controls.
  – Epoch 001: *Pediarix* + *ActHIB* and *Pentacel* + *Engerix-B*
  – Epoch 002: *Infanrix* + *ActHIB* and *Pentacel*.

Vaccination schedules:

Epoch 001

- **Hexa Group:** Subjects in this group will receive three doses of *Infanrix hexa* (lot A, lot B or lot C as per the group allocation) co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
  - Hexa_1 Group: Subjects will receive lot A of *Infanrix hexa,*
  - Hexa_2 Group: Subjects will receive lot B of *Infanrix hexa*
  - Hexa_3 Group: Subjects will receive lot C of *Infanrix hexa*.
- **Pedia Group:** Subjects in this group will receive three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
- **Penta Group**: Subjects in this group will receive three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

*Subjects in the Penta Group who have received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination should not receive *Engerix-B* at 4 months of age (Visit 2).

Epoch 002

- **Hexa Group**: Subjects will receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.
- **Pedia Group**: Subjects will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.
- **Penta Group**: Subjects will receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

The fourth dose of pneumococcal conjugate vaccine is recommended to be administered at approximately 12-15 months of age. Since the booster dose of the candidate vaccine/active controls will be given in this study at 15-18 months of age, the fourth dose of *Prevnar13* will not be administered as part of the study protocol. Subject's parent(s)/Legally Acceptable Representative(s) (LARs) will be reminded at Visit 3 and Visit 4 to consult their primary health care provider regarding the fourth dose of *Prevnar13* at 12-15 months for their child.

- As the analyses will be performed regardless of the lot of *Infanrix hexa* received, unless otherwise specified, the Hexa_1, Hexa_2 and Hexa_3 groups will be pooled together for the analysis and will be called the Hexa group.

- Treatment allocation: The subjects will be randomized at a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. This will be done at study entry using GSK Biologicals' central randomization system on internet (SBIR).

- Blinding: The study is open-label for both epochs (Table 3) due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing will be blinded to the treatment, and

codes will be used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

The blinding of study epochs is presented in Table 3.

Table 3 Blinding of study epochs

Study Epochs	Blinding
Epoch 001	open
Epoch 002	open

- Sampling schedule: Blood samples will be drawn from all subjects at the following time points:
  - Post-Pri (Visit 4): One month after the third dose of primary vaccination, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Pre-Bst (Visit 5): Before the administration of the booster dose, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Post-Bst (Visit 6): One month after the booster vaccination, a volume of at least 3.5 mL of whole blood (to provide at least 1.2 mL of serum) will be collected.
- Type of study: self-contained.
- Data collection: electronic Case Report Form (eCRF).

4. STUDY COHORT

4.1. Number of subjects/centers

Target enrolment will be 585 subjects (65 each in Hexa_1, Hexa_2, Hexa_3 groups and 195 each in Pedia and Penta groups). Enrolment will be terminated when the target number of subjects has been enrolled. Refer to Section 10.3 for a detailed description of the criteria used in the estimation of sample size.

This study will be conducted at multiple centers in the US.

Actual numbers of subjects enrolled versus target will be monitored by the site monitor using SBIR.

4.2. Inclusion criteria for enrolment

Deviations from inclusion criteria are not allowed because they can potentially jeopardize the scientific integrity of the study, regulatory acceptability or subject safety. Therefore, adherence to the criteria as specified in the protocol is essential.

All subjects must satisfy ALL the following criteria at study entry:

- Subjects' parent(s)/ LAR(s) who, in the opinion of the investigator, can and will comply, with the requirements of the protocol (e.g. completion of the diary cards, return for follow-up visits).
- A male or female between, and including, 6 and 12 weeks of age at the time of the first vaccination.
- Born full-term (i.e. after a gestation period of 37 weeks to less than 42 completed weeks [259 to 293 days]).
- Written informed consent obtained from parent(s)/LAR(s) of the subject.
- Healthy subjects as established by medical history and clinical examination before entering into the study.
- Infants who have not received a previous dose of hepatitis B vaccine or those who have received only 1 dose of hepatitis B vaccine administered at least 30 days prior to enrolment.

4.3. Exclusion criteria for enrolment

Deviations from exclusion criteria are not allowed because they can potentially jeopardize the scientific integrity of the study, regulatory acceptability or subject safety. Therefore, adherence to the criteria as specified in the protocol is essential.

The following criteria should be checked at the time of study entry. If ANY exclusion criterion applies, the subject must not be included in the study:

- Child in care

  Please refer to the glossary of terms for the definition of child in care.
- Use of any investigational or non-registered product (drug or vaccine) other than the study vaccines within 30 days preceding the first dose of study vaccines, or planned use during the study period.
- Chronic administration (defined as more than 14 days in total) of immunosuppressants or other immune-modifying drugs since birth. For corticosteroids, this will mean prednisone ≥ 0.5 mg/kg/day, or equivalent. Inhaled and topical steroids are allowed.
- Planned administration/administration of a vaccine not foreseen by the study protocol within the period starting from 30 days before the first vaccination until 30 days after Dose 3 (Epoch 001, primary vaccination) and from 30 days before the booster Dose 4 until 30 days after booster Dose 4 (Epoch 002, booster vaccination), i.e. the end of the study:
  - Inactivated influenza and hepatitis A vaccines are allowed throughout the study.
  - Routine administration(s) of vaccines are allowed from 30 days after the last dose of primary vaccination until 30 days before the booster dose and after post-booster blood sampling. Routine administration of measles-mumps-rubella

vaccine, varicella, pneumococcal vaccines are allowed from 30 days after last dose of primary vaccine until 30 days before booster dose and from post-booster blood sampling, as well as according to the recommended immunization schedule in US.

- Concurrently participating in another clinical study, at any time during the study period, in which the subject has been or will be exposed to an investigational or a non-investigational product (pharmaceutical product or device).
- History of Hib, diphtheria, tetanus, pertussis, pneumococcal, rotavirus, poliovirus and hepatitis B diseases.
- Previous vaccination against Hib, diphtheria, tetanus, pertussis, pneumococcus, rotavirus and/or poliovirus; more than one previous dose of hepatitis B vaccine.
- Any confirmed or suspected immunosuppressive or immunodeficient condition, based on medical history and physical examination (no laboratory testing required).
- Family history of congenital or hereditary immunodeficiency.
- History of any reaction or hypersensitivity likely to be exacerbated by any component of the vaccines (including yeast).
- Hypersensitivity to latex.
- Major congenital defects or serious chronic illness.
- History of any neurological disorders including seizures.
- Administration of immunoglobulins and/or any blood products since birth or planned administration during the study period.
- History of intussusception or of any uncorrected congenital malformation of the gastrointestinal tract that would predispose the infant to intussusception.
- History of Severe Combined Immunodeficiency Disease (SCID).
- Acute disease and/or fever at the time of enrolment.
  - Fever is defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002.
  - Subjects with a minor illness (such as mild diarrhea, mild upper respiratory infection) without fever may, be enrolled at the discretion of the investigator.

5. CONDUCT OF THE STUDY

5.1. Regulatory and ethical considerations, including the informed consent process

The study will be conducted in accordance with all applicable regulatory requirements.

The study will be conducted in accordance with the ICH Guideline for Good Clinical Practice (GCP), all applicable subject privacy requirements and the guiding principles of the Declaration of Helsinki.

The study has been designed and will be conducted in accordance with the ICH Harmonised Tripartite Guideline for clinical investigation of medicinal products in the paediatric population (ICH E11) and all other applicable ethical guidelines.

GSK will obtain favorable opinion/approval to conduct the study from the appropriate regulatory agency, in accordance with applicable regulatory requirements, prior to a site initiating the study in that country.

Conduct of the study includes, but is not limited to, the following:

- Institutional Review Board (IRB)/Independent Ethics Committee (IEC) review and favorable opinion/approval of study protocol and any subsequent amendments.
- Subject's parent(s)/LAR(s) informed consent.
- Investigator reporting requirements as stated in the protocol.

GSK will provide full details of the above procedures to the investigator, either verbally, in writing, or both.

Freely given and written informed consent must be obtained from each subject's parent(s)/LAR(s) prior to participation in the study.

GSK Biologicals will prepare a model Informed Consent Form (ICF) which will embody the ICH GCP and GSK Biologicals required elements. While it is strongly recommended that this model ICF is to be followed as closely as possible, the informed consent requirements given in this document are not intended to pre-empt any local regulations which require additional information to be disclosed for informed consent to be legally effective. Clinical judgement, local regulations and requirements should guide the final structure and content of the local version of the ICF.

The investigator has the final responsibility for the final presentation of the ICF, respecting the mandatory requirements of local regulations. The ICF generated by the investigator with the assistance of the sponsor's representative must be acceptable to GSK Biologicals and be approved (along with the protocol, and any other necessary documentation) by the IRB/IEC.

5.2. Subject identification and randomization of treatment

5.2.1. Subject identification

After checking the inclusion/exclusion criteria, subject numbers will be assigned sequentially to subjects whose parent(s)/LAR(s) give consent for their child to participate in the study, according to the range of subject numbers allocated to each study center. Subject numbers will also be used to identify blood samples collected during the study.

5.2.2. Randomization of treatment

5.2.2.1. Randomization of supplies

The numbering of supplies will be performed at GSK Biologicals, using MATerial EXcellence (MATEX), a program developed for use in Statistical Analysis System (SAS®) (Cary, NC, USA) by GSK Biologicals.

To allow GSK Biologicals to take advantage of greater rates of recruitment than anticipated at individual centers in this multi-center study and to thus reduce the overall study recruitment period, an over-randomization of supplies will be prepared.

5.2.2.1.1. Epoch 001

A first list based on a randomization blocking scheme using a [1:1:1]:3:3 randomization ratio will be used to number the following vaccines for Doses 1, 2 and 3.

- DTPa-HBV-IPV/Hib lot A
- DTPa-HBV-IPV/Hib lot B
- DTPa-HBV-IPV/Hib lot C
- *Pediarix*
- *Pentacel*

The vaccines from this list will be distributed to the study center while respecting the randomization block size.

ActHIB, Engerix-B, Prevnar13 and *Rotarix* will be numbered independently using a sequential numbering.

5.2.2.1.2. Epoch 002

Four sequential lists (one for *Infanrix*, one for *Hiberix*, one for *ActHIB* and one for *Pentacel*) will be used to number the vaccine doses for the Epoch 002.

The study staff in charge of the vaccine administration will access SBIR, provide the subject identification number and the dose number. The system will provide a new treatment number for all the vaccines to be administered to a subject (*Pentacel, Infanrix + ActHIB* or *Infanrix + Hiberix*). This will be consistent with the allocated study group.

5.2.2.2. Treatment allocation to the subject

The treatment numbers will be allocated by dose.

5.2.2.2.1. Study group and treatment number allocation

The target is to enroll 585 subjects to be randomly assigned to five study groups in a [1:1:1]:3:3 ratio (195 subjects in the pooled lots group).

Allocation of the subject to a study group at the investigator site will be performed using SBIR. The randomization algorithm will use a minimization procedure accounting for the study as a whole and each of the centers.

After obtaining the signed and dated ICF from the subject's parent(s)/LAR(s) and having checked the eligibility of the subject, the site staff in charge of the vaccine administration will access SBIR. Upon providing the subject identification number, the randomization system will ask whether the subject had a previous hepatitis B vaccination and will use the minimization algorithm to determine the group allocation and the appropriate treatment number for *Pentacel*, *Pediarix* or for *Infanrix hexa* (lot A, lot B or lot C) to be used for the subject.

SBIR will also provide treatment numbers for co-administered vaccines *Engerix B, ActHib, Prevnar13* vaccine and a *Rotarix* vaccine, each one labelled with a different treatment number. Therefore a subject will have three or four different treatment numbers allocated at dose 1.

The number of each administered treatment must be recorded in the eCRF on the Vaccine Administration screen.

When SBIR is not available, please refer to the SBIR user guide or the Study Procedures Manual (SPM) for specific instructions.

5.2.2.2.2. Treatment number allocation for subsequent doses

For each dose subsequent to the first dose, the study staff in charge of the vaccine administration will access SBIR, provide the subject identification number, the dose number and the system will provide new treatment numbers consistent with the allocated study group.

Each vaccine will be labeled with a different treatment number.

The number of each administered treatment must be recorded in the eCRF on the Vaccine Administration screen.

Note that in the Penta Group, the investigator will be reminded that *Engerix-B* is not allowed at dose 2 for subjects with previous hepatitis B vaccination. So for these subjects, the treatment identified by SBIR for dose 2 should not be used.

5.3. Method of blinding

The study will be open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing will be blinded to the treatment, and codes will be used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

5.4. General study aspects

Supplementary study conduct information not mandated to be present in this protocol is provided in the accompanying SPM. The SPM provides the investigator and the site personnel with administrative and detailed technical information that does not impact the safety of the subjects.

5.5. Outline of study procedures

The outline of study procedures is presented in Table 4.

○ is used to indicate a study procedure that does not require documentation in the individual eCRF

Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001

Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002

Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002

† Visit 3 should be conducted at least 8 weeks after Visit 2 and when the subject is at least 24 weeks of age

$^{\alpha}$ The child can still continue in the study even if the mother does not wish to provide consent to record her Tdap vaccination history.

$^{\beta}$ Only the Tdap vaccination history (during the pregnancy of the enrolled child) from mothers who have given consent to provide this information will be obtained and recorded in the eCRF.

[δ] For the Penta group, which receives only one vaccine at Visit 5, baseline measurement of only the limb receiving the vaccine is required
** If subject in the Penta Group received a birth dose of Hep B vaccine, no administration of *Engerix-B* is foreseen at Visit 2 (4-months of age)
* Refer to Section 8.1.3.1 and 5.6.2.11 for detailed explanation on the reporting of large injection site reactions
§ Refer to Section 6.7 for details
‖ Refer to Section 6.8 for details
‡ New onset of chronic disease (NOCD) includes events such as autoimmune disorders, asthma, type I diabetes and allergies
# Refer to Section 10.9.1 for details

.

It is the investigator's responsibility to ensure that intervals between visits are strictly followed. The intervals between study visits are presented in Table 5.

Table 5 Intervals between study visits

Interval	Optimal length of interval[1]
Birth→Visit 1	6-12 weeks (42-90 days) of age[2]
Visit 1 →Visit 2	49-83 days[2]
Visit 2 →Visit 3 *	56-90 days[2]
Visit 3 → Visit 4	30-48 days[2] †
Visit 3 → Phone call (ESFU contact)	180-210 days**
Birth→ Visit 5^	15-18 months of age[2]
Visit 5 → Visit 6	30-48 days[2] †

[1] Whenever possible the investigator should arrange within this interval;
[2] Subjects may not be eligible for inclusion in one or more cohorts for analysis if they make the study visit outside this interval. For Visit 3-Visit 4 and Visit 5-Visit 6, an interval of 21-48 days will be considered for the According-to-protocol (ATP) cohort of immunogenicity. Refer to Section 10.4 for the definition of the cohorts for analysis;
* Advisory Committee on Immunization Practices (ACIP) recommendation states that minimum age of last Hep B dose is 24 weeks and this last dose should be administered at least 8 weeks after the previous dose. So, Visit 3 should be conducted at least 8 weeks after Visit 2 and when the subject is at least 24 weeks of age
† It is preferred that subjects come in for Visit 4 and Visit 6, at least 30 days after Visits 3 and 5, respectively. If subjects return for the visit prior to 30 days, they should take home the diary card and continue to record unsolicited safety information until 30 days post-vaccination and mail/send it upon completion. Investigators will make an attempt to retrieve diary cards from subjects who have not mailed/sent them in.
^ Visit 5 should occur after the ESFU. ESFU must occur prior to vaccination if Visit 5 coincides with the 6 months post-Visit 3 time-point
** Adherence to the interval pertaining to phone contact is only indicative and will not determine a subject's eligibility for inclusion for ATP analysis. However, the interval should be respected in order to obtain safety information over the complete 6 months extended safety follow up period.

5.6. Detailed description of study procedures

5.6.1. Procedures prior to study participation

5.6.1.1. Informed consent

The signed informed consent of the subject's parent(s)/LAR(s) must be obtained before study participation.

5.6.2. Procedures during the study

5.6.2.1. Check inclusion and exclusion criteria

Check all inclusion and exclusion criteria as described in Sections 4.2 and 4.3 before enrolment.

5.6.2.2. Collect demographic data

Record demographic data such as date of birth, gender, geographic ancestry and ethnicity in the subject's eCRF.

5.6.2.3. Medical history

Obtain the subject's medical history by interview and/or review of the subject's medical records and record any pre-existing conditions or signs and/or symptoms present in a subject prior to the first study vaccination in the eCRF.

5.6.2.4. Vaccination history

Obtain the subject's vaccination history by interview and/or review of the subject's medical records and record any vaccinations given to the subject, including hepatitis B vaccines, prior to the first study vaccination in the eCRF. The Tdap vaccination history of the mother during pregnancy will also be collected and recorded in the eCRF (provided that the mother has consented to provide this information).

Note: Maternal vaccination is requested in order to be able to summarize the responses of the subjects to pertussis antigens according to whether or not the mothers received a pertussis vaccine during their pregnancy. This information will aid in understanding the effect of transplacentally transferred antibodies on the childs' immune response to vaccination.

5.6.2.5. History directed physical examination

Perform a history directed physical examination at Visit 1 (Epoch 001) and Visit 5 (Epoch 002). If the investigator determines that the subject's health on the day of vaccination temporarily precludes vaccination, the visit will be rescheduled. Collected information, including length and weight, needs to be recorded in the eCRF.

Treatment of any abnormality observed during this examination has to be performed according to local medical practice outside this study or by referral to an appropriate health care provider.

5.6.2.6. Study group and treatment number allocation

Study group and treatment number allocation will be performed as described in Section 5.2.2. The number of each administered treatment must be recorded in the eCRF.

5.6.2.7. Treatment number allocation for subsequent doses

The treatment number allocation for subsequent doses will be performed at Visits 2, 3 and 5 as described in Section 5.2.2. The number of each administered treatment must be recorded in the eCRF.

5.6.2.8. Assess pre-vaccination body temperature

The axillary, rectal, oral or tympanic body temperature of all subjects needs to be measured prior to the study vaccine administration at Visits 1, 2, 3 and 5. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002. If the subject has fever [fever is defined as temperature ≥38.0°C /100.4°F by any route] on the day of vaccination, the vaccination visit will be rescheduled within the allowed interval for this visit (see Table 5).

5.6.2.9. Sampling

Refer to the Module on Biospecimen Management in the SPM for detailed instructions for the collection, handling and processing of the samples.

5.6.2.9.1. Blood sampling for immune response assessments

Blood samples will be taken during certain study visits as specified in Section 5.5 List of Study Procedures.

- A volume of approximately 5.0 mL of whole blood to provide approximately 1.7 mL of serum should be drawn from all subjects for the analysis of humoral immune response at Visits 4 and 5. At least 3.5 mL of whole blood to provide approximately 1.2 mL of serum should be drawn from all subjects for the analysis of humoral immune response at Visit 6. After centrifugation, serum samples should be kept at –20°C/ –4°F or below until shipment. Refer to the SPM for more details on sample storage conditions.

5.6.2.10. Check contraindications, warnings and precautions to vaccination

Contraindications, warnings and precautions to vaccination must be checked at the beginning of each vaccination visit. Refer to Sections 6.5 and 6.6 for more details.

5.6.2.11. Baseline measurement of limb circumference after booster vaccination at visit 5

(Amendment 2: 17 April 2015)

During Epoch 002, baseline measurement of limb circumference (arms or legs according to where the vaccine was administered) at the level of the injection site should be obtained. For the Penta group, baseline measurement is only required for the limb that will be vaccinated. Clothing should be removed so as not to interfere with the measurement of the limb circumference. For measuring upper arm circumference, the measurement will be performed while the arm is held parallel to the trunk and the elbow is flexed in front at 90° (as if the subject is carrying a tray) [Kohl, 2007]. For measuring leg circumference the child should be standing or lying flat, as appropriate, as long as the leg is straight.

5.6.2.12. Study Vaccines administration

- After completing all prerequisite procedures prior to vaccination, one dose of study vaccine/control vaccines will be administered intramuscularly (IM) (refer to Section 6.3 for detailed description of the vaccines administration procedure). If the investigator or delegate determines that the subject's health on the day of administration temporarily precludes vaccine administration, the visit will be rescheduled within the allowed interval for this visit (refer to Table 5).

- The subjects will be observed closely for at least 30 minutes following the administration of the vaccines, with appropriate medical treatment readily available in case of anaphylaxis.

5.6.2.13. Recording of AEs, SAEs and NOCDs

(Amendment 2: 17 April 2015)

- Refer to Section 8.3 for procedures for the investigator to record AEs, SAEs and NOCDs. NOCDs include events such as autoimmune disorders, asthma, type I diabetes and allergies. Refer to Section 8.4 for guidelines on how to submit SAE reports to GSK Biologicals.

The subjects' parent(s)/LAR(s) will be instructed to contact the investigator immediately should the subjects manifest any signs or symptoms they perceive as serious.

- At each vaccination visit, diary cards will be provided to the subject's parent(s)/LAR(s). The subject's parent(s)/LAR(s) will record body (rectal for subjects in Epoch 001 and axillary for subjects in Epoch 002) temperature and any solicited local/general AEs (i.e. on the day of vaccination and during the next 3 days) or any unsolicited AEs (i.e. on the day of vaccination and during the next 30 days occurring after vaccination). The subject's parent(s)/LAR(s) will be instructed to return the completed diary card to the investigator at the next study visit.
- Collect and verify completed diary cards during discussion with the subject's parent(s)/LAR(s) on Visits 2, 3, 4 and 6.
- During Epoch 002, following the fourth dose vaccination, the parents/LAR(s) should be provided with a measurement device for recording circumference of injected limbs (arms or legs according to where vaccine was administered) at the level of the injection site on the day of vaccination and during the next three days on a diary card. The parents/LAR(s) should be instructed on how and where to perform the measurement of the circumference of the vaccinated limb. Daily measurements should be performed in the same manner preferably by the same person and at the same time of day during the 4-day follow-up (Day 0-Day 3) period.
- If the parent(s) /LAR(s) of infants observe any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of limb circumference) during the 4-day follow-up (Day 0-Day 3) period they are to contact study personnel and to visit the investigator's office for evaluation as soon as possible and to bring the diary card with them.

- In addition to the diameter of the swelling and the circumference of the limb that are reported as solicited symptoms, the parent(s)/LAR(s) will record the following additional symptoms/characteristics that may be associated with large injection site swelling reactions on the diary card:
  - Type of swelling (local swelling only around the injection site, diffuse swelling not involving the elbow or knee joint, swelling involving the elbow or knee joint)
  - Induration at injection site (largest diameter)
  - Pruritis at the injection site (intensity – scale provided)
  - Functional impairment (intensity – scale and description provided)
- The study personnel's evaluation will be recorded in the medical chart. In case the diary card score is not in line with the medical chart score, the medical chart will indicate what is the most intense score. The largest or most intense score for a given day will be recorded in the eCRF at the level of the solicited symptoms and at the level of the large swelling report form.
- Any unreturned diary cards will be sought from the subject's parent(s)/LAR(s) through telephone call(s) or any other convenient procedure. The investigator will transcribe the collected information into the eCRF in English.

5.6.2.14. Check and record concomitant medication/vaccination and intercurrent medical conditions

Concomitant medication/vaccination must be checked and recorded in the eCRF as described in Section 6.7.

Intercurrent medical conditions must be checked and recorded in the eCRF as described in Section 6.8.

5.6.2.15. Study conclusion

The investigator will:

- review data collected to ensure accuracy and completeness at ESFU contact and Visit 6
- complete the Study Conclusion screen in the eCRF.

At study completion, post-trial commercial vaccines will not be provided to the subjects.

5.7. Biological sample handling and analysis

Please refer to the SPM for details on biospecimen management (handling, storage and shipment).

Samples will not be labelled with information that directly identifies the subject but will be coded with the identification number for the subject (subject number).

Under the following circumstances, additional testing on the samples may be performed by GSK Biologicals outside the scope of this protocol:

- Collected samples may be used in other assays, for test improvement or development of analytical methods related to the study vaccines and its constituents or the disease under study.
- Collected samples may be used for purposes related to the quality assurance of data generated linked to the study vaccines or the disease under study, such as for maintenance of assays described in this protocol and comparison between analytical methods and/or laboratories.

Information on further investigations and their rationale can be obtained from GSK Biologicals.

Any sample testing will be done in line with the consent of the individual subject's parent(s)/LAR(s).

Refer also to the Investigator Agreement, where it is noted that the investigator cannot perform any other biological assays except those described in the protocol or its amendment(s).

If additional testing is performed, the marker priority ranking given in Section 5.7.4 may be changed.

Collected samples will be stored for a maximum of 20 years (counting from when the last subject performed the last study visit), unless local rules, regulations or guidelines require different timeframes or different procedures, which will then be in line with the subject consent. These extra requirements need to be communicated formally to and discussed and agreed with GSK Biologicals.

5.7.1. Use of specified study materials

When materials are provided by GSK Biologicals, it is MANDATORY that all clinical samples (including serum samples) be collected and stored exclusively using those materials in the appropriate manner. The use of other materials could result in the exclusion of the subject from the ATP analysis (See Section 10.4 for the definition of study cohorts/ data sets to be analysed). The investigator must ensure that his/her personnel and the laboratory(ies) under his/her supervision comply with this requirement. However, when GSK Biologicals does not provide material for collecting and storing clinical samples, appropriate materials from the investigator's site must be used. Refer to the Module on Clinical Trial Supplies in the SPM.

5.7.2. Biological samples

Table 6 Biological samples

Sample type	Quantity*	Unit	Timepoint
Blood	5	mL	Month 5 (Post-Pri)
Blood	5	mL	Month 13-16 (Pre-Bst)
Blood	3.5	mL	Month 14-17 (Post-Bst)

* Approximate quantity
Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002

5.7.3. Laboratory assays

(Amendment 2: 17 April 2015)

Please refer to APPENDIX A for the address of the clinical laboratories used for sample analysis.

At Visits 4, 5 and 6, blood will be collected for measurement of immune response. Total blood volume to be taken from each subject over the study period is approximately 13.5 mL (approximately 5.0 mL of whole blood to provide approximately 1.7 mL of serum at Visits 4 and 5 and at least 3.5 mL of whole blood to provide approximately 1.2 mL of serum at Visit 6). All serology will be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized procedures with adequate controls. ***All serology for primary endpoints will be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized, validated procedures with adequate controls.***

The laboratory assays for humoral immunity are presented in Table 7.

Table 7 Humoral Immunity (Antibody determination)

(Amendment 2: 17 April 2015)

System	Component	Method	Test kit/ Manufacturer	Unit	Cut-off†	Laboratory**
Serum	Bordetella pertussis.Pertussis Toxin Ab.IgG	ELISA	In-house*	EL.U/mL	5	GSK Biologicals§
Serum	Bordetella pertussis.Filamentous Hemaglutinin Ab.IgG	ELISA	In-house*	EL.U/mL	5	GSK Biologicals§
Serum	Bordetella pertussis.Pertactin Ab.IgG	ELISA	In-house*	EL.U/mL	5	GSK Biologicals§
Serum	Corynebacterium diphtheriae.Diphtheria Toxoid Ab.IgG	ELISA	In-house*	IU/mL	0.1	GSK Biologicals§
Serum	Clostridium tetani.Tetanus Toxoid Ab.IgG	ELISA	In-house*	IU/mL	0.1	GSK Biologicals§
Serum	Hepatitis B Virus.Surface Ab	CLIA	Centaur (Siemens Healthcare)	mIU/mL	6.2	GSK Biologicals§
Serum	Poliovirus Sabin Types 1, 2 and 3	NEUTRA	In-house*	ED_{50}	8	GSK Biologicals§
Serum	Haemophilus influenzae type b.Polyribosyl Ribitol Phosphate Ab ‡	ELISA	In-house*	µg/mL	0.15	GSK Biologicals§

*In-house refers to assays developed internally by GSK which can be performed at GSK Biologicals' laboratories or external laboratory designated by GSK
**Refer to APPENDIX A for the laboratory addresses.
§GSK Biologicals laboratory refers to the Global Vaccines Clinical Laboratories (GVCL) in Rixensart, Belgium; Wavre, †
†Due to ongoing re-validation of all assays, the cut-offs may be subject to change.
‡For anti-PRP post-dose 3, the assay is not yet qualified or validated.
Belgium and Laval, Canada.
ELISA = Enzyme-Linked Immunosorbent Assay
NEUTRA = Neutralization Assay
CLIA = ChemiLuminescence ImmunoAssay

The GSK Biologicals' clinical laboratories have established a Quality System supported by procedures. The activities of GSK Biologicals' clinical laboratories are audited regularly for quality assessment by an internal (sponsor-dependent) but laboratory-independent Quality Department.

5.7.4. Biological samples evaluation

5.7.4.1. Immunological read-outs

The immunological read-outs are presented in Table 8.

Table 8 Immunological read-outs

Blood sampling time point		No. of subjects	Components and priority rank
Type of contact and time point	Sampling time point		
Visit 4 (Month 5)	Post-Pri	585 (All)	PRN, FHA, PT PRP, D, T, HBs, Poliovirus type 1, Poliovirus type 2, Poliovirus type 3
Visit 5 (Month 13-16)	Pre-Bst	585 (All)	PRN, FHA, PT PRP, D, T, HBs, Poliovirus type 1, Poliovirus type 2, Poliovirus type 3
Visit 6 (Month 14-17)	Post-Bst	585 (All)	PRN, FHA, PT, PRP, D, T

Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002

In case of insufficient blood sample volume to perform assays for all antibodies, the samples will be analysed according to priority ranking provided in Table 8.

5.7.5. Immunological correlates of protection

The following cut-offs are accepted as immunological correlates of protection:

- Specific antibodies against diphtheria toxoid (anti-diphtheria) and tetanus toxoid (anti-tetanus) will be measured by enzyme-linked immunosorbent assay (ELISA). The assay cut-off of ELISA is set at 0.1 International Units per ml (IU/ml), which provides a conservative estimate of the percentage of subjects deemed to be protected [Camargo, 1984; Melville-Smith, 1983].
- Antibodies to the hepatitis B surface antigen (anti-HBs) will be measured using CLIA. The cut-off of the test is set at 6.2 mIU/ml. An antibody concentration ≥10 mIU/ml defines seroprotection [CDC, 1991; WHO, 1988].
- Antibodies against poliovirus types 1, 2 and 3 will be determined by a virus micro-neutralization test adapted from the World Health Organization Guidelines for WHO/EPI Collaborative Studies on Poliomyelitis [WHO, 1993]. The lowest dilution at which serum samples will be tested is 1:8, from which a test will be considered positive. Titers will be expressed in terms of the reciprocal of the dilution resulting in 50% inhibition. Antibody titers greater than or equal to this value are considered as protective.
- Data from subjects given unconjugated Hib vaccine suggest that, in the absence of induction of immunological memory, a concentration of 0.15 µg/mL is indicative of short-term protection, with 1 µg/mL considered indicative of long-term protection [Käyhty, 1983; Anderson, 1984].
- No serological correlate of protection against pertussis has been established [Granström, 1987; Karpinsky, 1987]. Antibodies against the pertussis components

s PT, FHA and PRN will be measured by ELISA. The seropositivity cut-off for all three pertussis antibodies in ELISA is 5 EL.U/ml. Subjects with antibody concentration below the cut-off will be considered seronegative.

For the purpose of identification of sub-optimal responders and communication to the investigators, anti-HBs and anti-poliovirus types 1, 2 and 3 assessment of the protection level will be done for each subject on samples taken approximately 4 weeks after the 3rd dose of the primary vaccination. For PRP, D and T antigens, the assessment of the protection level will be done for each subject on samples taken approximately 4 weeks after the administration of the booster dose. In addition a listing of subjects who did not seroconvert to anti-PT, anti-FHA and anti-PRN will be provided.

The immunological assay results will be communicated to the investigator within one year following the last subject visit for the relevant time point (Visit 4 for HBV and poliovirus; Visit 6 for PRP, D, T and pertussis antigens).

The investigator is encouraged to share the immunological assay results for non-responders with the study subjects' parent(s)/LAR(s).

For the study subjects identified as non-responders, it remains the responsibility of the study investigator in charge of the subject's clinical management to determine the medical need for re-vaccination and to re-vaccinate the subjects as per local/regional practices.

6. STUDY VACCINES AND ADMINISTRATION

6.1. Description of study vaccines

All candidate vaccines to be used have been developed and manufactured by GSK Biologicals.

The Quality Control Standards and Requirements for each candidate vaccine are described in separate Quality Assurance documents (e.g. release protocols, certificate of analysis) and the required approvals have been obtained.

The vaccines are labeled and packed according to applicable regulatory requirements.

Commercial vaccines are assumed to comply with the specifications given in the manufacturer's Summary of Product Characteristics.

Table 9 Study vaccines

(Amendment 2: 17 April 2015)

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Infanrix hexa	DTPa-HBV-IPV	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; Aluminium=700µg Al3+	The DTPa-HBV-IPV component is presented as a turbid white suspension in a pre-filled syringe.	full volume^	3
	Hib	PRP=10µG; TT~=25µG Aluminum as salts = 0.12 mg	The lyophilized Hib component is presented as a white pellet in a glass vial; it must be reconstituted before use with the DTPa-HBV-IPV component.		
Pediarix	DTPa-HBV-IPV	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; Aluminium=700µg Al3+	The DTPa-HBV-IPV component is presented as a turbid white suspension in a pre-filled syringe.	0.5 mL	3
ActHIB	ActHIB	Hib=10µg TT, TT=24µg	White lyophilized pellet in a single dose vial, it must be reconstituted before use with sterile 0.4% saline solution	0.5 mL*	4
	NaCl	NaCl=60mM	Sterile 0.4% saline solution		
Pentacel	DTaP-IPV (Sanofi Pasteur)	PT=20µg; FHA=20µg; FIM=5µg; PRN=3µg; DT=15Lf; TT=5Lf; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; PRP=10µg TT,TT=24µg; $AlPO_4$=330µg Al3+	Suspension for injection (0.5-mL dose) supplied as a liquid vaccine component in a single dose vial. ***The lyophilized Hib component is presented as a white pellet in a separate glass vial. It must be reconstituted with the liquid DTaP-IPV component before use.***	0.5 mL*	4
Engerix-B	HBV	HBsAg=10µg; $Al(OH)_3$=250µg Al3+	Suspension pre-filled syringe	0.5 mL	2 or 3**

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Infanrix	DTPa	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; $AlPO_4$=500µg Al3+	Homogeneous, turbid, white suspension in a pre-filled syringe	0.5 mL	1
Hiberix	Hib	PRP=10µG; TT~=25µG	The lyophilized Hib component is presented as a white pellet in a glass vial; it must be reconstituted before use with sterile 0.9% saline solution.	0.5 mL*	1
	NaCl	NaCl=150mM	Sterile 0.9% saline solution		
Prevnar13	Prevenar 13	PS1=2.2µg CRM197; PS3=2.2µg CRM197; PS4=2.2µg CRM197; PS5=2.2µg CRM197; PS6A=2.2µg CRM197; PS6B=4.4µg CRM197; PS7F=2.2µg CRM197; PS9V=2.2µg CRM197; PS14=2.2µg CRM197; PS18C=2.2µg CRM197; PS19A=2.2µg CRM197; PS19F=2.2µg CRM197; PS23F=2.2µg CRM197; $AlPO_4$=125µg Al3+	Suspension for injection in a pre-filled syringe.	0.5 mL	3
Rotarix	HRV	HRV RIX4144=$10^{6.0}$ $CCID_{50}$	Lyophilized vaccine in a monodose glass vial to be reconstituted with the calcium carbonate buffer diluent)	1.0 mL*	2
	$CaCO_3$	$CaCO_3$=60µg	Diluent (calcium carbonate liquid buffer) supplied separately in prefilled syringe		

$CCID_{50}$ = median Cell Culture Infective Dose; DMEM = Dulbecco's Modified Eagle Medium
* After reconstitution
** Subjects in the Penta Group who receive a birth dose of hepatitis B vaccine should not receive *Engerix-B* at the Month 4 visit (Visit 2)
^ Full volume after reconstitution (approximately 0.5 mL) to be administered

6.2. Storage and handling of study vaccines

The study vaccines must be stored at the respective label storage temperature conditions in a safe and locked place. Access to the storage space should be limited to authorized study personnel. The storage conditions will be assessed during pre-study activities under the responsibility of the sponsor study contact. The storage temperature should be continuously monitored with calibrated (if not validated) temperature monitoring device(s) and recorded. Refer to the Module on Clinical Trial Supplies in the SPM for more details on storage of the study vaccines.

Temperature excursions must be reported in degree Celsius.

Any temperature excursion outside the range of 0.0 to +8.0°C (for +2 to +8°C/+36 to +46°F label storage condition) impacting investigational medicinal products (IMPs) must

be reported in the appropriate (electronic) temperature excursion decision form ([e]TDF). The impacted IMPs must not be used and must be stored in quarantine at label temperature conditions until usage approval has been obtained from the sponsor.

In case of temperature excursion below +2.0°C down to 0.0°C impacting IMP(s) there is no need to report in (e)TDF, but adequate actions must be taken to restore the +2 to +8°C/+36 to +46°F label storage temperature conditions. The impacted IMP(s) may still be administered, but the site should avoid re-occurrence of such temperature excursion. Refer to the Module on Clinical Trial Supplies in the SPM for more details on actions to take.

Refer to the Module on Clinical Trial Supplies in the SPM for details and instructions on the temperature excursion reporting and usage decision process, packaging and accountability of the study vaccines.

6.3. Dosage and administration of study vaccines

The injectable vaccines must be administered intramuscularly, at a 90-degree angle into the anterolateral side of the thigh [CDC, 2002] on the side stated in Table 10. The buttock should not be used.

In order to ensure proper intramuscular injection of the vaccines, a needle of at least 1 inch (2.54 cm) length, 25 gauge will be used [Diggle, 2006; Zuckerman, 2000].

For reconstitution of *Infanrix hexa* vaccine, an appropriate needle should be attached to the prefilled syringe containing the DTPa-HBV-IPV liquid vaccine and inserted into the vial containing the lyophilized Hib vaccine. The entire contents of the syringe should be transferred to the vial. With needle still inserted, the vial should be vigorously shaken. After reconstitution, the full volume of the vial (approximately 0.5 mL) is then withdrawn using the same syringe. A new needle should then be affixed to the syringe for administration of the vaccine.

NOTE: After reconstitution, *Infanrix hexa* should be injected immediately. However the vaccine may be kept for up to 8 hours at room temperature (21°C).

The vaccinees will be observed closely for at least 30 minutes following the administration of vaccines, with appropriate medical treatment readily available in case of a rare anaphylactic reaction.

Rotarix must be exclusively administered orally. DO NOT INJECT.

Table 10 Dosage and administration

Visit	Study Group	Treatment name	Route [1]	Site [2]	Side [3]
Epoch 001					
1, 2, 3	Hexa Group	*Infanrix hexa* (lot A, lot B or lot C)	IM	T	R
1, 2, 3		*Prevnar13*	IM	T	LoL
1, 2		*Rotarix*	O	-	-

1, 2		*Rotarix*	O	-	-
Epoch 002*					
5	Hexa Group	*Infanrix*	IM	T	R
		Hiberix	IM	T	L
5	Pedia Group	*Infanrix*	IM	T	R
		ActHIB	IM	T	L
5	Penta Group	*Pentacel*	IM	T	R

[1]Oral (O), Intramuscular (IM); [2]Thigh (T), [3]Left (L), Right (R), Upper Left (UpL), Lower Left (LoL)
Note: Vaccination can be performed in the opposite side in case of medical indication preventing vaccination in the side stated in the table, as judged by the investigator
†Subjects in the Penta Group who receive a birth dose of hepatitis B vaccine should not receive *Engerix-B* at the Month 4 visit (Visit 2).
***** Toddlers (12 Months through 2 Years): For toddlers, the vastus lateralis muscle in the anterolateral thigh is preferred. The needle should be at least 1-inch long. The deltoid muscle can be used if the muscle mass is adequate.

6.4. Replacement of unusable vaccine doses

In addition to the vaccine doses provided for the planned number of subjects (including over-randomization when applicable), at least 60% additional vaccine doses will be supplied to replace those that are unusable.

6.5. Contraindications to subsequent vaccination

6.5.1. Absolute contraindications:

The following events constitute absolute contraindications to further administration of the study and co-administration vaccines. If any of these events occur during the study, the subject must not receive additional doses of vaccine but may continue other study procedures at the discretion of the investigator.

- Anaphylaxis following the administration of vaccine(s).
- Other hypersensitivity reaction to any component of the vaccine(s) and any excipients in the formulation, including yeast.
- Hypersensitivity to latex.

- Contraindication for pertussis-containing vaccines:
  - Encephalopathy of unknown etiology, defined as an acute, severe central nervous system disorder, occurring within 7 days following previous vaccination with pertussis-containing vaccine and generally consisting of major alterations in consciousness, unresponsiveness, generalised or focal seizures that persist more than a few hours, with failure to recover within 24 hours.
  - Individuals with progressive neurologic disorder, including infantile spasms, uncontrolled epilepsy, or progressive encephalopathy should not receive a pertussis-containing vaccine until a treatment regimen has been established and the condition has stabilized.
- Contraindications to *Rotarix*:
  - Subjects with uncorrected congenital malformation (such as Meckel's diverticulum) of the gastrointestinal tract that would predispose for intussusceptions.
  - History of intussusception or history of SCID.

6.5.2. Temporary contraindications:

The following events constitute contraindications to administration of the study and co-administration vaccines at that point in time; if any of these events occur at the time scheduled for vaccination, the subject may be vaccinated at a later date, within the time window specified in the protocol, or withdrawn at the discretion of the investigator.

- Acute disease and/or fever at the time of vaccination.
  - Fever is defined as temperature ≥ 38.0°C/100.4°F by any route. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002.
  - Subjects with a minor illness (such as mild upper respiratory infection) without fever can be administered all vaccines.
- Acute diarrhea or vomiting is a contra-indication to the administration of *Rotarix* at that point in time.

6.6. Warnings and precautions

The information below presents, in addition to the contraindications in Section 6.5, warnings and precautions to administration of *Infanrix hexa.*

- As with other vaccines, administration of *Infanrix hexa* should be postponed in subjects suffering from acute severe febrile illness. The presence of a minor infection is not a contra-indication.
- Vaccination should be preceded by a review of the medical history (especially with regard to previous vaccination and possible occurrence of undesirable events) and a clinical examination.

- If any of the following events are known to have occurred in temporal relation to receipt of pertussis-containing vaccine, the decision to give further doses of pertussis-containing vaccines should be carefully considered:
  - Temperature of ≥ 40.0°C within 48 hours, not due to another identifiable cause.
  - Collapse or shock-like state (hypotonic-hyporesponsiveness episode) within 48 hours of vaccination.
  - Persistent, inconsolable crying lasting ≥ 3 hours, occurring within 48 hours of vaccination.
  - Convulsions with or without fever, occurring within 3 days of vaccination.
- As with all injectable vaccines, appropriate medical treatment and supervision should always be readily available in case of a rare anaphylactic event following the administration of the vaccine.
- *Infanrix hexa* should be administered with caution to subjects with thrombocytopenia or a bleeding disorder since bleeding may occur following an intramuscular administration to these subjects.
- *Infanrix hexa* should under no circumstances be administered intravascularly or intradermally.
- A protective immune response may not be elicited in all vaccinees.
- A history of febrile convulsions, a family history of convulsions or Sudden Infant Death Syndrome (SIDS) do not constitute contraindications for the use of *Infanrix hexa*. Vaccinees with a history of febrile convulsions should be closely followed up as such adverse events may occur within 2 to 3 days post vaccination.
- Since the Hib capsular polysaccharide antigen is excreted in the urine a positive urine test can be observed within 1-2 weeks following vaccination. Other tests should be performed in order to confirm Hib infection during this period.
- Syncope (fainting) can occur following, or even before, any vaccination as a psychogenic response to the needle injection. It is important that procedures are in place to avoid injury from faints.

Refer to the approved product label/package insert for warnings and precautions for the use of *Pediarix, ActHIB, Pentacel, Engerix-B, Prevnar13, Rotarix, Hiberix* and *Infanrix* vaccines.

6.7. Concomitant medication/product and concomitant vaccination

At each study visit/contact, the investigator should question the subject's parent(s)/LAR(s) about any medication/product taken and vaccination received by the subject.

6.7.1. Recording of concomitant medications/products and concomitant vaccination

The following concomitant medications/products/vaccines must be recorded in the eCRF if administered during the indicated recording period:

- All concomitant medications/products, except vitamins and dietary supplements, administered within 30 days following each dose of study vaccine.
- Any concomitant vaccination administered since birth and ending 30 days after the booster dose (Visit 6). Vaccinations listed prior to the first dose of study vaccine are to be recorded as vaccination history. The fourth dose of *Prevnar 13* will be recorded as concomitant vaccination.
- Prophylactic medication (i.e. medication administered in the absence of ANY symptom and in anticipation of a reaction to the vaccination).

  E.g. an anti-pyretic is considered to be prophylactic when it is given in the absence of fever and any other symptom, to prevent fever from occurring [fever is defined as temperature ≥ 38.0°C/100.4°F by any route].
- Any concomitant medications/products/vaccines listed in Section 6.7.2.
- Any concomitant medication/product/vaccine relevant to a SAE* or administered at any time during the study period for the treatment of a SAE*.

  * Refer to those SAEs that are required to be reported per protocol.

6.7.2. Concomitant medications/products/vaccines that may lead to the elimination of a subject from ATP analyses

The use of the following concomitant medications/products/vaccines will not require withdrawal of the subject from the study but may determine a subject's evaluability in the ATP analysis. See Section 10.4 for study cohorts/ data sets to be analysed.

- Any investigational or non-registered product (drug or vaccine) other than the study vaccines used during the study period (starting from Visit 1 and ending at Visit 6).
- Immunosuppressants or other immune-modifying drugs administered chronically (i.e. more than 14 days) during the study period until the final blood sample (Visit 6). For corticosteroids, this will mean prednisone ≥ 0.5 mg/kg/day, or equivalent. Inhaled and topical steroids are allowed.
- A vaccine not foreseen by the study protocol administered during the period starting from 30 days before the first vaccination until Post-Pri blood sampling i.e. approximately 30 days after Dose 3 (Epoch 001) and from 30 days before Pre-Bst until Post-Bst blood sampling i.e. approximately 30 days after Dose 4 (Epoch 002). Thus, routine administration(s) of measles-mumps-rubella, varicella and pneumococcal vaccines are allowed from 30 days after the last dose of primary vaccination (after Post-Pri blood sampling) until 30 days before the booster dose and from 30 days after the booster dose (after Post-Bst blood sampling), as well as according to the recommended immunization schedule in the US.

- Exceptions:
  - Inactivated influenza vaccine and hepatitis A vaccines are allowed throughout the study.

  In case an emergency mass vaccination for an unforeseen public health threat (e.g.: a pandemic) is organized by the public health authorities, outside the routine immunization program, the time period described above can be reduced if necessary for that vaccine provided it is licensed and used according to its SPC or PI and according to the local governmental recommendations and provided a written approval of the Sponsor is obtained.
- Immunoglobulins and/or any blood products administered during the study period until the final blood sample (Visit 6).

6.8. Intercurrent medical conditions that may lead to elimination of a subject from ATP analyses

At each study visit subsequent to the first vaccination visit, it must be verified if the subject has experienced or is experiencing any intercurrent medical condition. If it is the case, the condition(s) must be recorded in the eCRF.

- Subjects may be eliminated from the ATP cohort for immunogenicity if they incur a condition that has the capability of altering their immune response or are confirmed to have an immunodeficiency condition.
- Subjects will be eliminated from the ATP cohort for immunogenicity if they experience intercurrent diphtheria, tetanus, pertussis, poliomyelitis, hepatitis B and/or Hib prior to the post-dose 3 blood draw and diphtheria, tetanus, pertussis and/or Hib post-dose 4 blood draw.

7. HEALTH ECONOMICS

Not applicable.

8. SAFETY

The investigator or site staff is/are responsible for the detection, documentation and reporting of events meeting the criteria and definition of an adverse event (AE) or serious adverse event (SAE) as provided in this protocol.

Each subject's parent(s)/LAR(s) will be instructed to contact the investigator immediately should the subject manifest any signs or symptoms they perceive as serious.

8.1. Safety definitions

8.1.1. Definition of an adverse event

An AE is any untoward medical occurrence in a clinical investigation subject, temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product.

An AE can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a medicinal product. For marketed medicinal products, this also includes failure to produce expected benefits (i.e. lack of efficacy), abuse or misuse.

Examples of an AE include:

- Significant or unexpected worsening or exacerbation of the condition/indication under study.
- New conditions detected or diagnosed after investigational vaccines administration even though they may have been present prior to the start of the study.
- Signs, symptoms, or the clinical sequelae of a suspected interaction.
- Signs, symptoms, or the clinical sequelae of a suspected overdose of either investigational vaccines or a concurrent medication (overdose per se should not be reported as an AE/SAE).
- Signs, symptoms temporally associated with vaccine administration.
- Significant failure of expected pharmacological or biological action.
- Pre- or post-treatment events that occur as a result of protocol-mandated procedures (i.e. invasive procedures, modification of subject's previous therapeutic regimen).

AEs to be recorded as endpoints (solicited AEs) are described in Section 8.1.3. All other AEs will be recorded as UNSOLICITED AEs.

Examples of an AE DO NOT include:

- Medical or surgical procedures (e.g. endoscopy, appendectomy); the condition that leads to the procedure is an AE/SAE.
- Situations where an untoward medical occurrence did not occur (e.g. social and/or convenience admission to a hospital, admission for routine examination).
- Anticipated day-to-day fluctuations of pre-existing disease(s) or condition(s) present or detected at the start of the study that do not worsen.
- Pre-existing conditions or signs and/or symptoms present in a subject prior to the first study vaccination. These events will be recorded in the medical history section of the eCRF**.**

8.1.2. Definition of a serious adverse event

A serious adverse event is any untoward medical occurrence that:

a. Results in death,

b. Is life-threatening,

   Note: The term 'life-threatening' in the definition of 'serious' refers to an event in which the subject was at risk of death at the time of the event. It does not refer to an event, which hypothetically might have caused death, had it been more severe.

c. Requires hospitalisation or prolongation of existing hospitalisation,

   Note: In general, hospitalisation signifies that the subject has been admitted at the hospital or emergency ward for observation and/or treatment that would not have been appropriate in the physician's office or in an out-patient setting. Complications that occur during hospitalisation are also considered AEs. If a complication prolongs hospitalisation or fulfils any other serious criteria, the event will also be considered serious. When in doubt as to whether 'hospitalisation' occurred or was necessary, the AE should be considered serious.

   Hospitalisation for elective treatment of a pre-existing condition (known or diagnosed prior to informed consent signature) that did not worsen from baseline is NOT considered an AE.

d. Results in disability/incapacity,

   Note: The term disability means a substantial disruption of a person's ability to conduct normal life functions. This definition is not intended to include experiences of relatively minor medical significance such as uncomplicated headache, nausea, vomiting, diarrhea, influenza like illness, and accidental trauma (e.g. sprained ankle) which may interfere or prevent everyday life functions but do not constitute a substantial disruption.

Medical or scientific judgement should be exercised in deciding whether reporting is appropriate in other situations, such as important medical events that may not be immediately life-threatening or result in death or hospitalisation but may jeopardise the subject or may require medical or surgical intervention to prevent one of the other outcomes listed in the above definition. These should also be considered serious. Examples of such events are invasive or malignant cancers, intensive treatment in an emergency room or at home for allergic bronchospasm, blood dyscrasias or convulsions that do not result in hospitalisation.

8.1.3. Solicited adverse events

A 4-day follow-up (Day 0-Day 3) of solicited local (at each injection site) and general AEs will be performed after administration of the vaccine. Data concerning the following AEs will be solicited using diary cards provided by the sponsor.

8.1.3.1. Solicited local (injection-site) adverse events

The following local (injection-site) AEs will be solicited (Table 11):

Table 11 Solicited local adverse events

Pain at injection site
Redness at injection site
Swelling at injection site
Post-dose 4 measurements of circumference of limbs (arm or leg according to where vaccine was administered)

N.B. If parent(s) /LAR(s) of infants observe any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of limb circumference) after the booster dose at Visit 5, they are to contact study personnel and to visit the investigator's office for evaluation as soon as possible and bring the diary card with them. The investigator will record detailed information describing the AE on a specific large injection site reaction form in the eCRF. In addition to the diameter of the swelling and the circumference of the limb that are reported as solicited symptoms the parent(s)/LAR(s) will need to record additional symptoms/characteristics as mentioned in Section 5.6.2.13.

Note: local AEs will not be solicited for co-administered vaccines like *Prevnar 13*.

8.1.3.2. Solicited general adverse events

The following general AEs will be solicited (Table 12):

Table 12 Solicited general adverse events

Drowsiness
Fever
Irritability/Fussiness
Loss of appetite

Note: Temperature will be recorded in the evening. Should additional temperature measurements be performed at other times of day, the highest temperature will be recorded. Fever is defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002.

8.1.4. Clinical laboratory parameters and other abnormal assessments qualifying as adverse events or serious adverse events

In absence of diagnosis, abnormal laboratory findings (e.g. clinical chemistry, haematology, urinalysis) or other abnormal assessments (e.g. vital signs etc.) that are judged by the investigator to be clinically significant will be recorded as AE or SAE if they meet the definition of an AE or SAE (refer to Sections 8.1.1 and 8.1.2). Clinically significant abnormal laboratory findings or other abnormal assessments that are present at

baseline and significantly worsen following the start of the study will also be reported as AEs or SAEs. However, clinically significant abnormal laboratory findings or other abnormal assessments that are associated with the disease being studied, unless judged by the investigator as more severe than expected for the subject's condition, or that are present or detected at the start of the study and do not worsen, will not be reported as AEs or SAEs.

The investigator will exercise his or her medical and scientific judgement in deciding whether an abnormal laboratory finding or other abnormal assessment is clinically significant.

8.1.5. Adverse events of specific interest

Adverse events of specific interest (i.e. NOCDs such as autoimmune disorders, asthma, type I diabetes and allergies) will be recorded from Day 0 up to 6 months after the last primary vaccination (Epoch 001) and from booster dose up to one month after booster vaccination (Epoch 002). NOCDs will be reported as either AEs or SAEs, as appropriate in the eCRF.

8.2. Events or outcomes not qualifying as adverse events or serious adverse events

Not applicable.

8.3. Detecting and recording adverse events and serious adverse events

8.3.1. Time period for detecting and recording adverse events and serious adverse events

All AEs starting within 30 days following administration of each dose of study vaccine/comparator must be recorded into the appropriate section of the eCRF, irrespective of intensity or whether or not they are considered vaccination-related.

The time period for collecting and recording SAEs and AEs of specific interest will begin at the first receipt of study vaccine/comparator and will end 180 days following administration of the last dose of study vaccine/comparator of the primary vaccination course for each subject and 30 days following administration of the booster dose. See Section 8.4 for instructions on reporting of SAEs.

All AEs/SAEs leading to withdrawal from the study will be collected and recorded from the time of the first receipt of study vaccine/comparator.

In addition to the above-mentioned reporting requirements and in order to fulfil international reporting obligations, SAEs that are related to study participation (i.e. protocol-mandated procedures, invasive tests, a change from existing therapy) or are related to a concurrent GSK medication/vaccine will be collected and recorded from the time the subject consents to participate in the study until she/he is discharged from the study.

Note: With the exception of AEs/SAEs leading to withdrawal, study participation and concurrent GSK medications or vaccines, there is no reporting of SAEs from the time of the Epoch 1 ESFU phone contact and administration of dose 4 (approximately three months).

An overview of the protocol-required reporting periods for AEs and SAEs is given in Table 13.

Table 13 Reporting periods for adverse events and serious adverse events

Study activity	C.O	V1	4-days post vac	31-days post-vac	V2	4-days post vac	31-days post-vac	V3	4-days post- vac	31-days post-vac	Phone call 6 months post-V3	V5	4-days post- vac	31-days post-vac
Age of subject		2 months			4 months			6 months		7 months	12 months	15-18 months		16-19 months
Solicited local and general AEs														
Large injection site reactions														
Unsolicited AEs														
AEs/SAEs leading to withdrawal from the study														
NOCDs														
SAEs														
SAEs related to study participation or concurrent GSK medication/vaccine														

NOCD: New Onset of Chronic Diseases; C.O: consent obtained; V: Visit; Post-V: Post-Visit; vac: vaccination

8.3.2. Post-Study adverse events and serious adverse events

A post-study AE/SAE is defined as any event that occurs outside of the AE/SAE reporting period defined in Table 13. Investigators are not obligated to actively seek AEs or SAEs in former study participants. However, if the investigator learns of any SAE at any time after a subject has been discharged from the study, and he/she considers the event reasonably related to the investigational vaccine/product, the investigator will promptly notify the Study Contact for Reporting SAEs.

8.3.3. Evaluation of adverse events and serious adverse events

8.3.3.1. Active questioning to detect adverse events and serious adverse events

As a consistent method of collecting AEs, the subject's parent(s)/LAR(s) should be asked a non-leading question such as:

'*Has your child acted differently or felt different in any way since receiving the vaccine or since the last visit?*'

When an AE/SAE occurs, it is the responsibility of the investigator to review all documentation (e.g. hospital progress notes, laboratory and diagnostics reports) relative to the event. The investigator will then record all relevant information regarding an AE/SAE in the eCRF. The investigator is not allowed to send photocopies of the subject's medical records to GSK Biologicals instead of appropriately completing the eCRF. However, there may be instances when copies of medical records for certain cases are requested by GSK Biologicals. In this instance, all subject identifiers will be blinded on the copies of the medical records prior to submission to GSK Biologicals.

The investigator will attempt to establish a diagnosis pertaining to the event based on signs, symptoms, and/or other clinical information. In such cases, the diagnosis should be documented as the AE/SAE and not the individual signs/symptoms.

8.3.3.2. Assessment of adverse events

8.3.3.2.1. Assessment of intensity

The intensity of the following solicited AEs will be assessed as described:

Table 14 Intensity scales for solicited symptoms in infants/toddlers

Infant/Toddler (15–24 months)		
Adverse Event	**Intensity grade**	**Parameter**
Pain at injection site	0	None
	1	Mild: Minor reaction to touch
	2	Moderate: Cries/protests on touch
	3	Severe: Cries when limb is moved/spontaneously painful
Redness at injection site		Record greatest surface diameter in mm
Swelling at injection site		Record greatest surface diameter in mm
Increase in limb circumference post-dose 4 (arm or leg according to where vaccine was administered)		Record the limb circumference at the level of the injection site
Fever*		Record temperature in °C/°F
Irritability/Fussiness	0	Behaviour as usual
	1	Mild: Crying more than usual/no effect on normal activity
	2	Moderate: Crying more than usual/interferes with normal activity
	3	Severe: Crying that cannot be comforted/prevents normal activity
Drowsiness	0	Behaviour as usual
	1	Mild: Drowsiness easily tolerated
	2	Moderate: Drowsiness that interferes with normal activity
	3	Severe: Drowsiness that prevents normal activity
Loss of appetite	0	Appetite as usual
	1	Mild: Eating less than usual/no effect on normal activity
	2	Moderate: Eating less than usual/interferes with normal activity
	3	Severe: Not eating at all

* Fever is defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002.

The maximum intensity of local injection site redness/swelling/fever will be scored at GSK Biologicals as follows:

0 : Absent
1 : ≤ 5 mm
2 : > 5 mm and ≤ 20 mm
3 : > 20 mm

The maximum intensity of fever will be scored at GSK Biologicals as follows:

0	=	<100.4°F	<38.0°C
1	=	≥100.4°F to ≤102.2°F	≥38.0°C to ≤39.0°C
2	=	>102.2°F to ≤104.0°F	>39.0°C to ≤40.0°C
3	=	> 104.0°F	> 40.0°C

Following each vaccination (3 doses during the primary vaccination course and one booster dose) during the 4 days after the vaccine dose has been administered (day of vaccination and subsequent 3 days), the child's temperature will be screened each evening, at bedtime, for signs of fever by means of the rectal/axillary thermometer. Children < 15 months will have their temperature taken rectally and children ≥ 15 months will have their temperature taken by the axillary route. Rectal/axillary temperatures will be recorded on the diary card. Temperature measured by any route will be presented in 0.5°C increments starting at 38°C/100.4°F.

Prior to analysis, the increase in limb circumference of each limb as compared to the baseline pre-vaccination measurement will be scored for each subject at GSK Biologicals' as follows:

Grade 0 = Increase in limb circumference ≤5 mm

1 = Increase in limb circumference >5 mm but ≤20 mm

2 = Increase in limb circumference >20 mm but ≤40 mm

3 = Increase in limb circumference >40 mm

The investigator will assess the maximum intensity that occurred over the duration of the event for all unsolicited AEs (including SAEs) recorded during the study. The assessment will be based on the investigator's clinical judgement.

For unsolicited symptoms and adverse events associated with large injection site reactions (e.g. pruritus, induration and functional impairment, the intensity should be assigned to one of the following categories:

1 (mild)	=	An AE which is easily tolerated by the subject, causing minimal discomfort and not interfering with everyday activities.
2 (moderate)	=	An AE which is sufficiently discomforting to interfere with normal everyday activities.
3 (severe)	=	An AE which prevents normal, everyday activities. In a young child, such an AE would, for example, prevent attendance at school/kindergarten/a day-care center and would cause the parent(s)/LAR(s) to seek medical advice.

An AE that is assessed as Grade 3 (severe) should not be confused with a SAE. Grade 3 is a category used for rating the intensity of an event; and both AEs and SAEs can be assessed as Grade 3. An event is defined as 'serious' when it meets one of the pre-defined outcomes as described in Section 8.1.2.

8.3.3.2.2. Assessment of causality

The investigator is obligated to assess the relationship between investigational vaccines and the occurrence of each AE/SAE. The investigator will use clinical judgement to determine the relationship. Alternative plausible causes, such as natural history of the underlying diseases, concomitant therapy, other risk factors, and the temporal relationship of the event to the investigational vaccines will be considered and investigated. The investigator will also consult the IB and/or PI for marketed products to determine his/her assessment. Investigational vaccines include vaccines such as *Infanrix hexa*, *Pediarix*, *Pentacel*, *ActHIB*, *Engerix-B*, *Rotarix*, *Prevnar 13*, *Infanrix* and *Hiberix*.

There may be situations when a SAE has occurred and the investigator has minimal information to include in the initial report to GSK Biologicals. However, it is very important that the investigator always makes an assessment of causality for every event prior to submission of the SAE report to GSK Biologicals. The investigator may change his/her opinion of causality in light of follow-up information and update the SAE information accordingly. The causality assessment is one of the criteria used when determining regulatory reporting requirements.

In case of concomitant administration of multiple vaccines, it may not be possible to determine the causal relationship of general AEs to the individual vaccines administered. The investigator should, therefore, assess whether the AE could be causally related to vaccination rather than to the individual vaccines.

All solicited local (injection site) reactions will be considered causally related to vaccination. Causality of all other AEs should be assessed by the investigator using the following question:

Is there a reasonable possibility that the AE may have been caused by the investigational vaccines?

YES	:	There is a reasonable possibility that the vaccines contributed to the AE.
NO	:	There is no reasonable possibility that the AE is causally related to the administration of the study vaccine(s). There are other, more likely causes and administration of the study vaccine(s) is not suspected to have contributed to the AE.

If an event meets the criteria to be determined as 'serious' (see Section 8.1.2), additional examinations/tests will be performed by the investigator in order to determine ALL possible contributing factors for each SAE.

Possible contributing factors include:

- Medical history.
- Other medication.
- Protocol required procedure.
- Other procedure not required by the protocol.
- Lack of efficacy of the vaccines, if applicable.
- Erroneous administration.
- Other cause (specify).

8.3.3.3. Assessment of outcomes

The investigator will assess the outcome of all unsolicited AEs (including SAEs) recorded during the study as:

- Recovered/resolved.
- Recovering/resolving.
- Not recovered/not resolved.
- Recovered with sequelae/resolved with sequelae.
- Fatal (SAEs only).

8.3.3.4. Medically attended visits

For each solicited and unsolicited symptom the subject experiences, the subject's parent(s)/LAR(s) will be asked if the subject received medical attention defined as hospitalisation, or an otherwise unscheduled visit to or from medical personnel for any reason, including emergency room visits. This information will be recorded in the eCRF.

8.4. Reporting of serious adverse events and other events

8.4.1. Prompt reporting of serious adverse events and other events to GSK Biologicals

SAEs that occur in the time period defined in Section 8.3 will be reported promptly to GSK within the timeframes described in Table 15, once the investigator determines that the event meets the protocol definition of a SAE.

Table 15 Timeframes for submitting serious adverse event and other events reports to GSK Biologicals

Type of Event	Initial Reports		Follow-up of Relevant Information on a Previous Report	
	Timeframe	Documents	Timeframe	Documents
SAEs	24 hours*	electronic SAE report	24 hours*	electronic SAE report

* Timeframe allowed after receipt or awareness of the information.

8.4.2. Contact information for reporting serious adverse events and other events to GSK Biologicals

Back-up Study Contact for Reporting SAEs
24/24 hour and 7/7 day availability: GSK Biologicals Clinical Safety & Pharmacovigilance Fax: +PPD or +PPD Please refer to the Study Procedure Manual for the dedicated US Fax Machine number.

8.4.3. Completion and transmission of SAE reports to GSK Biologicals

Once an investigator becomes aware that a SAE has occurred in a study subject, the investigator (or designate) must complete the information in the electronic SAE report WITHIN 24 HOURS. The SAE report will always be completed as thoroughly as possible with all available details of the event. Even if the investigator does not have all information regarding a SAE, the report should still be completed within 24 hours. Once additional relevant information is received, the report should be updated WITHIN 24 HOURS.

The investigator will always provide an assessment of causality at the time of the initial report.

8.4.3.1. Back-up system in case the electronic SAE reporting system does not work

If the electronic SAE reporting system does not work, the investigator (or designate) must complete, then date and sign a paper SAE report and fax it to the GSK Biologicals Clinical Safety and Pharmacovigilance department within 24 hours. Please refer to the Study Procedure Manual for the dedicated US Fax Machine number.

This back-up system should only be used if the electronic SAE reporting system is not working and NOT if the system is slow. As soon as the electronic SAE reporting system is working again, the investigator (or designate) must complete the electronic SAE report within 24 hours. The final valid information for regulatory reporting will be the information reported through the electronic SAE reporting system.

8.4.4. Updating of SAE information after freezing of the subject's eCRF

When additional SAE information is received after freezing of the subject's eCRF, new or updated information should be recorded on a paper report, with all changes signed and dated by the investigator. The updated report should be faxed to the GSK Biologicals Clinical Safety and Pharmacovigilance department or to the Study Contact for Reporting SAEs (refer to the Sponsor Information Sheet) within the designated reporting time frames specified in Table 15.

8.4.5. Regulatory reporting requirements for serious adverse events

The investigator will promptly report all SAEs to GSK in accordance with the procedures detailed in Section 8.4.1. GSK Biologicals has a legal responsibility to promptly notify, as appropriate, both the local regulatory authority and other regulatory agencies about the safety of a product under clinical investigation. Prompt notification of SAEs by the investigator to the Study Contact for Reporting SAEs is essential so that legal obligations and ethical responsibilities towards the safety of other subjects are met.

Investigator safety reports are prepared according to the current GSK policy and are forwarded to investigators as necessary. An investigator safety report is prepared for a SAE(s) that is both attributable to the investigational vaccine/product and unexpected. The purpose of the report is to fulfil specific regulatory and GCP requirements, regarding the product under investigation.

8.5. Follow-up of adverse events and serious adverse events

8.5.1. Follow-up during the study

After the initial AE/SAE report, the investigator is required to proactively follow each subject and provide additional relevant information on the subject's condition to GSK Biologicals (within 24 hours for SAEs; refer to Table 15).

All SAEs documented at a previous visit/contact and designated as not recovered/not resolved or recovering/resolving will be reviewed at subsequent visits/contacts until the end of the study.

All AEs documented at a previous visit/contact and designated as not recovered/not resolved or recovering/resolving will be reviewed at subsequent visits/contacts until 30 days after the last vaccination.

New onset of chronic diseases (such as autoimmune disorders, asthma, type I diabetes and allergies) documented at a previous visit/contact and designated as not recovered/not

resolved or recovering/resolving will be reviewed at subsequent visits/contacts until end of the study.

8.5.2. Follow-up after the subject is discharged from the study

The investigator will follow subjects:

- with SAEs, or subjects withdrawn from the study as a result of an AE, until the event has resolved, subsided, stabilized, disappeared, or until the event is otherwise explained, or the subject is lost to follow-up.
- with other non-serious AEs of specific interest, i.e. NOCDs, such as autoimmune disorders, asthma, type I diabetes and allergies, until the end of the study period or they are lost to follow-up.

If the investigator receives additional relevant information on a previously reported SAE, he/she will provide this information to GSK Biologicals using a paper SAE form.

GSK Biologicals may request that the investigator performs or arranges the conduct of additional clinical examinations/tests and/or evaluations to elucidate as fully as possible the nature and/or causality of the AE or SAE. The investigator is obliged to assist. If a subject dies during participation in the study or during a recognized follow-up period, GSK Biologicals will be provided with any available post-mortem findings, including histopathology.

8.6. Treatment of adverse events

Treatment of any AE is at the sole discretion of the investigator and according to current good medical practice. Any medication administered for the treatment of an AE should be recorded in the subject's eCRF (refer to Section 6.7).

8.7. Subject card

Study subjects' parent(s)/LAR(s) must be provided with the address and telephone number of the main contact for information about the clinical study.

The investigator (or designate) must therefore provide a "subject card" to each subject's parent(s)/LAR(s). In an emergency situation this card serves to inform the responsible attending physician that the subject is in a clinical study and that relevant information may be obtained by contacting the investigator.

Subjects' parent(s)/LAR(s) must be instructed to keep subject cards in their possession at all times.

9. SUBJECT COMPLETION AND WITHDRAWAL

9.1. Subject completion

A subject who returns for the concluding visit/is available for the concluding contact foreseen in the protocol is considered to have completed the study.

9.2. Subject withdrawal

Withdrawals will not be replaced.

9.2.1. Subject withdrawal from the study

From an analysis perspective, a 'withdrawal' from the study refers to any subject who did not come back for the concluding visit/was not available for the concluding contact foreseen in the protocol.

All data collected until the date of withdrawal/last contact of the subject will be used for the analysis.

A subject is considered a 'withdrawal' from the study when no study procedure has occurred, no follow-up has been performed and no further information has been collected for this subject from the date of withdrawal/last contact.

Investigators will make an attempt to contact those subjects who do not return for scheduled visits or follow-up.

Information relative to the withdrawal will be documented in the eCRF. The investigator will document whether the decision to withdraw a subject from the study was made by the subject's parent(s) or LAR(s), or by the investigator, as well as which of the following possible reasons was responsible for withdrawal:

- Serious adverse event.
- Non-serious adverse event.
- Protocol violation (specify).
- Consent withdrawal, not due to an adverse event*.
- Moved from the study area.
- Lost to follow-up.
- Other (specify).

*In case a subject is withdrawn from the study because the subject's parent(s) has withdrawn consent, the investigator will document the reason for withdrawal of consent, if specified by the subject, in the eCRF.

Subjects who are withdrawn from the study because of SAEs/AEs must be clearly distinguished from subjects who are withdrawn for other reasons. Investigators will follow subjects who are withdrawn from the study as result of a SAE/AE until resolution of the event (see Section 8.5.2).

9.2.2. Subject withdrawal from investigational vaccine

A 'withdrawal' from the investigational vaccine refers to any subject who does not receive the complete treatment, i.e. when no further planned dose is administered from

the date of withdrawal. A subject withdrawn from the investigational vaccine may not necessarily be withdrawn from the study as further study procedures or follow-up may be performed (safety or immunogenicity) if planned in the study protocol.

Information relative to premature discontinuation of the investigational vaccine will be documented on the Vaccine Administration screen of the eCRF. The investigator will document whether the decision to discontinue further vaccination/treatment was made by the subject's parent(s) or LAR(s), or by the investigator, as well as which of the following possible reasons was responsible for withdrawal:

- Serious adverse event.
- Non-serious adverse event.
- Other (specify).

10. STATISTICAL METHODS

10.1. Primary endpoint

10.1.1. Epoch 001 (Primary vaccination)

- Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.

10.2. Secondary endpoints

10.2.1. Epoch 001 (Primary vaccination)

- Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa, Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*.
  - Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3 and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.

- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after each vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after each vaccination, according to the **Med**ical **D**ictionary for **R**egulatory **A**ctivities (MedDRA) classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from Day 0 up to six months post primary vaccination.

10.2.2. Epoch 002 (Booster vaccination)

- Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Infanrix.*
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).

  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).

- Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix*.
  - Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4)
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after booster vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after booster vaccination, according to the MedDRA classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from the booster dose up to one month after the booster vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from the booster dose up to one month after the booster vaccination.

10.3. Determination of sample size

Target enrolment will be 585 subjects. Assuming 65% of the subjects will be evaluable post-dose 3, this will provide approximately 378 subjects (126 subjects in each group) evaluable for immunogenicity in the Epoch 001.

The sample size has been estimated in order to obtain at least 94% power to demonstrate the primary inferential objective (i.e. non-inferiority of the response to the pertussis antigens). The power associated to the target sample size for the conclusion on the inferential primary objective of this study is detailed in the next section.

10.3.1. Control on type I error

A 2.5% nominal type I error will be used for each pertussis non-inferiority (NI) evaluation. Since NI has to be met simultaneously for the 3 pertussis antigens, the global type I error will be below 2.5%.

10.3.2. References for sample size

References were chosen based on observed standard deviations observed in studies Hib-MenCY-TT-005 (101858) and Hib-MenCY-TT-009 (103813) one month post-dose 3 from the subjects that receive *ActHIB* co-administered with *Pediarix* and *Prevnar*, and from study DTPa-HBV-IPV-027 (217744/027) one month post-dose 3 from the DTPa-HBV-IPV/Hib pooled groups. All these studies enrolled subjects in the US.

The standard deviation for $\log_{10}$ transformed concentrations post vaccination for pertussis antigens is presented in Table 16.

Table 16 Standard deviation for $\log_{10}$ transformed concentration post vaccination

Study	Antigen					
	PT		FHA		PRN	
	N	SD	N	SD	N	SD
Hib-MenCY-TT-005-US	215	0.274	213	0.312	217	0.392
Hib-MenCY-TT-009 – US cohort	100	0.258	97	0.252	101	0.482
DTPa-HBV-IPV-027-US	865	0.274	802	0.254	869	0.376
Reference taken		0.274		0.307		0.392

N: Number of subjects; SD: standard deviation

10.3.3. Power computation

Out of the 585 subjects enrolled, 65% (126 in each pooled group) are expected to be evaluable post-Dose 3.

The individual type II error for each pertussis antigen was obtained using PASS 2005, one-sided non-inferiority test for 2 means from normal data with common variance between groups, under the alternative of equal means and alpha=2.5% (Table 17).

To account for the multiplicity of comparisons, the global type II error was conservatively estimated as the sum of individual type II errors, ensuring a global power for the study of 94.02% as presented in Table 17.

Table 17 Power for pertussis NI post-Dose 3

Antigen	Margin	SD on $\log_{10}$ transformed titer	Type I error	N evaluable per pooled group	Type II error
PT	1.5	0.274	2.5%	126	0.08%
FHA	1.5	0.307	2.5%	126	0.48%
PRN	1.5	0.392	2.5%	126	5.42%
Global Power = 100-(0.08+0.48+5.42) % = 94.02%					

10.4. Study cohorts/ data sets to be analysed

Six cohorts are defined for the purpose of the analysis:

- Primary Total Vaccinated cohort
- Primary ATP cohort for analysis of safety
- Primary ATP cohort for analysis of immunogenicity
- Booster Total Vaccinated cohort
- Booster ATP cohort for analysis of safety
- Booster ATP cohort for analysis of immunogenicity

10.4.1. Primary Total vaccinated cohort

The Primary Total Vaccinated cohort (TVC) will include all vaccinated subjects for whom data are available.

- A safety analysis based on the Primary TVC will include all subjects with at least one vaccine administration documented.
- An immunogenicity analysis based on the Primary TVC will include all vaccinated subjects for whom data concerning at least one immunogenicity endpoint measure is available.

10.4.2. Primary ATP cohort for analysis of safety

The Primary ATP cohort for safety will consist of all subjects from the Primary TVC who complied with the protocol up to the end of Epoch 001, namely all subjects:

- who meet all inclusion criteria and no exclusion criteria for the study
- who have received all planned study vaccines for each completed vaccination visit in Epoch 001;
- for whom administration site of study vaccines is known and is according to protocol;
- who did not receive a product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.7.2.

Note that for the purpose of ATP cohort definition, the Epoch 001 ends at Visit 4.

Adherence to the interval related to ESFU phone contact will not be taken into account for inclusion in ATP cohort for safety.

10.4.3. Primary ATP cohort for analysis of immunogenicity

The Primary ATP cohort for immunogenicity will consist of all subjects from the Primary ATP cohort for safety who complied with eligibility criteria and study procedures (see Table 5 for the definition of the intervals) up to the post-dose 3 blood sample and had immunogenicity results for the post-dose 3 blood sample. The analysis will be performed per treatment (first dose) actually administered.

More specifically, the analysis post-dose 3 based on the ATP cohort for immunogenicity will include all eligible subjects:

- who receive all the study vaccines up to dose 3 as per the vaccination schedule;
- for whom administration site and route of study vaccines up to dose 3 is as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.7.2
- who did not present with a medical condition before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.8.
- who comply with the post-dose 3 blood sample schedule, i.e. 21-48 days post-dose 3.
- who were not administered a vaccine not foreseen by the study protocol before the corresponding post-vaccination blood sample.
- who have immunogenicity results post-dose 3.

10.4.4. Booster Total vaccinated cohort

The Booster TVC will include all subjects from primary TVC that received the booster vaccine dose.

- For the Booster-TVC analysis of safety, this will include all subjects with booster vaccine administration documented.
- For the Booster-TVC analysis of immunogenicity, this will include vaccinated subjects for whom data concerning immunogenicity endpoint measures are available.

10.4.5. Booster ATP cohort for analysis of safety

The Booster ATP cohort for safety will consist of all subjects from the Booster TVC who complied with the protocol up to the end of Epoch 002, namely all subjects:

- who meet all inclusion criteria and no exclusion criteria for the study
- who have received the planned booster dose at 15-18 months of age;
- who received 3 doses in Epoch 001;
- for whom administration site of study vaccines is known and is according to protocol;

- who did not receive a product before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis as listed in Section 6.7.2.

10.4.6. Booster ATP cohort for analysis of immunogenicity

The Booster ATP cohort for immunogenicity will consist of all subjects from the Booster ATP cohort for safety who complied with eligibility criteria and study procedures (see Table 5 for the definition of the intervals) up to the post-dose 4 blood sample and had immunogenicity results for the post-dose 4 blood sample.

More specifically, the analysis pre- and post-dose 4 based on the Booster ATP cohort for immunogenicity will include all eligible subjects:

- who receive all the study vaccines up to dose 4 as per the vaccination schedule;
- for whom administration site and route of the study vaccines up to dose 4 is as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis (see Section 6.7.2);
- who did not present with a medical condition before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis (see Section 6.8);
- who comply with the booster vaccination schedule at 15-18 months of age and with the post-dose 4 blood sample schedule i.e. 21-48 days for post-dose 4;
- who have immunogenicity results post-dose 4.

10.5. Derived and transformed data

- A seronegative subject is a subject whose antibody concentration/titer is below the assay cut-off.
- A seropositive subject is a subject whose antibody concentration/titer is greater than or equal to the assay cut-off defined in Table 7.

  Note: Due to ongoing re-validation of all assays, these cut-offs may be subject to change.
- A seroprotected subject is a subject whose antibody concentration/titer is greater than or equal to the level defining clinical protection. The following seroprotection thresholds are applicable:
  - Anti-diphtheria antibody concentrations ≥ 0.1 IU/mL.
  - Anti-tetanus antibody concentrations ≥ 0.1 IU/mL.
  - Anti-HBs antibody concentrations ≥ 10 mIU/mL.
  - Anti-poliovirus types 1, 2 and 3 antibody titers ≥ 8.
  - Anti-PRP antibody concentrations ≥ 0.15 µg/mL.
- Other cut-offs to be considered:
  - Anti-PRP antibody concentrations ≥ 1.0 µg/mL.

  - Anti-diphtheria and anti-tetanus antibody concentrations ≥ 1.0 IU/mL

- Booster responses for anti-PT, anti-FHA and anti-PRN antibodies are defined as:
  - initially seronegative subjects (pre-booster antibody concentration below cut-off: < 5 ELISA EL.U/mL) with an increase of at least four times the cut-off one month after vaccination (post-booster antibody concentration ≥20 EL.U/mL), and
  - initially seropositive subjects with pre-booster antibody concentration ≥ 5 EL.U./mL and < 20 EL.U/mL with an increase of at least four times the pre-booster antibody concentration one month after vaccination, and,
  - For initially seropositive subjects with pre-booster antibody concentration ≥ 20 EL.U/mL with an increase of at least two times the pre-booster antibody concentration, one month after vaccination.

  Note: Due to ongoing re-validation of pertussis assays, the definition of booster responses may be subject to change.

- The GMC/GMT calculations will be performed by taking the anti-log of the mean of the $\log_{10}$ titer/ concentration transformations. Antibody titers/concentrations below the cut-off of the assay will be given an arbitrary value of half the cut-off for the purpose of GMC/GMT calculation.

Handling of missing data:

Immunogenicity:

- For a given subject and a given immunogenicity measurement, missing or non-evaluable measurements will not be replaced.

Safety/reactogenicity:

- For a given subject and the analysis of solicited symptom within 4 days post-vaccination, missing or non-evaluable measurements will not be replaced. Therefore the analysis of the solicited symptoms based on the Total Vaccinated cohort will include only vaccinated subjects and doses with documented safety data (i.e. symptom screen completed).
- For analysis of unsolicited adverse events, such as serious adverse events or adverse events by primary MedDRA term, and for the analysis of concomitant medications, all vaccinated subjects will be considered. Subjects who did not report the event or the concomitant medication will be considered as subjects without the event or the concomitant medication respectively.
- For summaries reporting both solicited and unsolicited adverse events, all vaccinated subjects will be considered. Subjects for whom the event will not be reported will be considered as subjects without the event.

10.6. Final analysis of the Epoch 001

10.6.1. Analysis of demographics

Demographic characteristics (age [weeks], gender, geographical ancestry, height in length [cm], weight [kg] at first dose, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status will be summarised by group using descriptive statistics:

- Frequency tables will be generated for categorical variables such as center;
- Mean, median and standard error will be provided for continuous data such as age.

The distribution of subjects enrolled among the study sites will be tabulated as a whole and per group.

10.6.2. Analysis of immunogenicity

The primary analysis will be based on the primary ATP cohort for immunogenicity. An analysis on the primary Total Vaccinated cohort will be performed only if, in any vaccine group and at any time point, more than 5% of the vaccinated subjects with immunological data post-dose 3 are excluded from the primary ATP cohort for immunogenicity.

The following section describes the analyses that will be performed.

10.6.2.1. Within group assessment

For each group, one month post-dose 3 and for each assay for which a serological result is available:

- Seropositivity and seroprotection rates with exact 95% CIs will be calculated.
- GMCs/GMTs with 95% CIs will be tabulated.
- For D,T and pertussis antigens, additional summaries will be provided according to the Tdap vaccination history of mother during pregnancy.

For each antigen, antibody concentration or titer distribution one month post-vaccination will be tabulated and displayed using reverse cumulative curves (RCCs).

10.6.2.2. Between group assessment

At one month post-dose 3,

- The asymptotic standardized 95% CI for the group difference in the seropositivity/ seroprotection rates will be computed for each antigen.
- The 95% CI for each group GMC/GMT ratio will be computed using an Analysis of Variance (ANOVA) model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of

Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis b at birth vaccine dose status will also be used as regressor.

10.6.2.3. Interpretation of analyses

Except for analyses addressing criteria specified in the primary objective, comparative analyses will be descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses should not be interpreted for formal conclusions since there is no adjustment for multiplicity of endpoints.

10.6.3. Analysis of safety

The primary analysis will be based on the primary Total Vaccinated cohort. If, in any vaccine group and at any time point of the Epoch 001, the percentage of vaccinated subjects excluded from the primary ATP cohort for safety is more than 5%, a second analysis based on the primary ATP cohort for safety will be performed to complement the primary Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) or 31-day (Days 0-30) follow-up period will be tabulated after each vaccine dose and overall (for the Epoch 001) with exact 95% CI.
- The percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 4-day or 31-day follow-up period will be tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses with local AEs (solicited and unsolicited) will be calculated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines, as well as overall (all sites considered).
- The percentage of subjects/doses reporting each individual solicited local and general AE during the 4-day follow-up period will be tabulated for each group as follows:
  - Over the primary doses, the percentage of subjects with the symptom and its exact 95% CI.
  - Over the primary doses, the percentage of doses with the symptom and its exact 95% CI.
  - At each study dose, the percentage of subjects with the symptom and its exact 95% CI.

  The exact 95% CIs will be calculated assuming independence between doses.
- All computations mentioned above will be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit.

- For fever, analyses will be performed by 0.5°C increments.
- The percentage of subjects/doses with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination will be tabulated after each dose and over the Epoch 001.
- The verbatim reports of unsolicited AEs will be reviewed by a clinical development manager and the signs and symptoms will be coded according to MedDRA. Every verbatim term will be matched with the appropriate Preferred Term. The percentage of subjects/doses with unsolicited AEs occurring within 31 days with exact 95% CI will be tabulated by Preferred Term. Similar tabulations will be done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to 6 months after the last primary vaccination will be tabulated by Preferred Term.
- Subjects who experienced at least one SAE reported before the database lock for the Epoch 001 analysis with an onset date in the Epoch 001 will be reported and the SAE will be described in detail.

10.7. Final analysis of the Epoch 002

10.7.1. Analysis of demographics/baseline characteristics

Demographic characteristics (age in months at Visit 5) and withdrawal status will be summarized by group using descriptive statistics:

- Frequency tables will be generated for categorical variables such as race/ethnicity;
- Mean, median and standard error will be provided for continuous data such as age.

The distribution of subjects vaccinated at Visit 5 among the study sites will be tabulated as a whole and per group.

For enrolled subjects that do not participate in the Epoch 002, the reason for not participating will be summarized.

10.7.2. Analysis of immunogenicity

The primary analysis will be based on the booster ATP cohort for immunogenicity. An analysis on the booster Total Vaccinated cohort will be performed only if, in any vaccine group and at any time point of the Epoch 002, more than 5% of the vaccinated subjects with immunological data are excluded from the booster ATP cohort for immunogenicity.

The following section describes the analyses that will be performed.

10.7.2.1. Within group assessment

For each group, prior to the booster dose and one month post-booster dose and for each assay for which a serological result is available:

- Seropositivity and seroprotection rates and booster response rates for pertussis with exact 95% CIs will be calculated.
- GMCs/GMTs with 95% CIs will be tabulated.

For D,T and pertussis antigens, additional summaries will be provided according to the Tdap vaccination history of mother during pregnancy.

For each antigen, antibody concentration or titer distribution before and one month Post-booster (when available) will be tabulated and displayed using RCCs.

10.7.2.2. Between group assessment

At pre-booster and at one month post-booster,

- The asymptotic standardized 95% CI for the group difference in the seroprotection/ seropositivity rates will be computed for each antigen.
- The 95% CI for each group GMC/GMT ratio will be computed using an ANOVA model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B at birth vaccine dose status will also be used as regressor.

10.7.2.3. Interpretation of analyses

In Epoch 002, all comparative analyses will be descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses should not be interpreted for formal conclusions since there is no adjustment for multiplicity of endpoints.

10.7.3. Analysis of safety

The primary analysis for the Epoch 002 will be based on the booster Total Vaccinated cohort and will only look at the booster dose. If, in any vaccine group, the percentage of vaccinated subjects excluded from the booster ATP cohort for safety is more than 5%, a second analysis based on the booster ATP cohort for safety will be performed to complement the booster Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period after the booster dose, will be tabulated with exact 95% CI for each group.

- The incidence of local AEs (solicited and unsolicited) will be calculated at each injection site as well as overall (all sites considered) for each group.
- The percentage of subjects reporting each individual solicited local and general AE during the 4-day follow-up period will be tabulated with its exact 95% CI for each group.
- All computations mentioned above will be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit.
- For fever, analyses will be performed by 0.5°C increments.
- The percentage of subjects with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination will be tabulated for each group.
- The verbatim reports of unsolicited AEs will be reviewed by a clinical development manager and the signs and symptoms will be coded according to MedDRA. Every verbatim term will be matched with the appropriate Preferred Term. The percentage of subjects with unsolicited AEs occurring within 31 days following the booster dose with its exact 95% CI will be tabulated by Preferred Term. Similar tabulations will be done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.

Additionally,

- Any large injection site reaction (defined as a swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase in limb circumference) reported within 4 days (Days 0-3) following the booster dose will be described in detail.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from booster dose up to one month after booster vaccination will be tabulated by Preferred Term.
- Subjects who experienced at least one SAE from the booster dose to study end will be reported and the SAEs will be described in detail.

10.8. Statistical methods

- The exact CIs for a proportion within a group will be calculated from Proc StatXact [Clopper, 1934].
- The standardized asymptotic CI for the group difference in proportion is the method implemented in Proc StatXact 7.0. It corresponds to method 6 in the Newcombe paper [Newcombe, 1998].
- The CI for GMTs/GMCs will be obtained within each group separately. The CI for the mean of log-transformed titer/concentration will be first obtained assuming that log-transformed values were normally distributed with unknown variance. The CI for

the GMTs/GMCs will then be obtained by exponential-transformation of the CI for the mean of log-transformed titer/concentration.

- The GMT/GMC group ratio will be obtained using an ANOVA model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B status at birth vaccine dose will also be used as regressor. The GMC/GMT group ratio and its CI will be derived as exponential-transformation of the corresponding group contrast in the model.

10.9. Conduct of analyses

Any deviation(s) or change(s) from the original statistical plan outlined in this protocol will be described and justified in the final study report.

10.9.1. Sequence of analyses

(Amendment 2: 17 April 2015)

The analyses will be performed ***stepwise***:

1. ***A partial analysis of Epoch 001 up to one month after the third primary vaccine dose will be conducted. This analysis will include the final analysis of anti-PRP, solicited and unsolicited symptoms on data as clean as possible. This analysis will be displayed on GSK clinical trial registry as soon as possible.***
2. ***The final data analysis of the study covering both the epochs will be conducted at the end of the study. All these analyses will be presented in a final clinical study report.***

10.9.2. Statistical considerations for interim analyses

All analyses will be conducted on final data and therefore no statistical adjustment for interim analyses is required.

11. ADMINISTRATIVE MATTERS

To comply with ICH GCP administrative obligations relating to data collection, monitoring, archiving data, audits, confidentiality and publications must be fulfilled.

11.1. Remote Data Entry instructions

RDE, a validated computer application, will be used as the method for data collection.

In all cases, subject initials will not be collected nor transmitted to GSK. Subject data necessary for analysis and reporting will be entered/transmitted into a validated database or data system. Clinical data management will be performed in accordance with applicable GSK standards and data cleaning procedures.

While completed eCRFs are reviewed by a GSK Biologicals' Site Monitor at the study site, omissions or inconsistencies detected by subsequent eCRF review may necessitate clarification or correction of omissions or inconsistencies with documentation and approval by the investigator or appropriately qualified designee. In all cases, the investigator remains accountable for the study data.

The investigator will be provided with a CD-ROM of the final version of the data generated at the investigational site once the database is archived and the study report is complete and approved by all parties.

11.2. Study Monitoring by GSK Biologicals

GSK will monitor the study to verify that, amongst others, the:

- Data are authentic, accurate, and complete.
- Safety and rights of subjects are being protected.
- Study is conducted in accordance with the currently approved protocol, any other study agreements, GCP and all applicable regulatory requirements.

The investigator and the head of the medical institution (where applicable) agrees to allow the monitor direct access to all relevant documents.

The investigator must ensure provision of reasonable time, space and qualified personnel for monitoring visits.

Direct access to all study-site related and source data is mandatory for the purpose of monitoring review. The monitor will perform a RDE review and a Source Document Verification (SDV). By SDV we understand verifying RDE entries by comparing them with the source data that will be made available by the investigator for this purpose.

The Source Documentation Agreement Form describes the source data for the different data in the RDE. This document should be completed and signed by the site monitor and investigator and should be filed in the monitor's and investigator's study file. Any data item for which the RDE will serve as the source must be identified, agreed and documented in the source documentation agreement form.

For RDE, the monitor will mark completed and approved screens at each visit.

Upon completion or premature discontinuation of the study, the monitor will conduct site closure activities with the investigator or site staff, as appropriate, in accordance with applicable regulations, GCP, and GSK procedures.

11.3. Record retention

Following closure of the study, the investigator must maintain all site study records (except for those required by local regulations to be maintained elsewhere) in a safe and secure location. The records must be easily accessible, when needed (e.g. audit or inspection), and must be available for review in conjunction with assessment of the facility, supporting systems, and staff. Where permitted by applicable laws/regulations or

institutional policy, some or all of these records can be maintained in a validated format other than hard copy (e.g. microfiche, scanned, electronic); however, caution needs to be exercised before such action is taken. The investigator must ensure that all reproductions are legible and are a true and accurate copy of the original and meet accessibility and retrieval standards, including re-generating a hard copy, if required. Furthermore, the investigator must ensure that an acceptable back-up of the reproductions exists and that there is an acceptable quality control procedure in place for making these reproductions.

GSK will inform the investigator/institution of the time period for retaining these records to comply with all applicable regulatory requirements. However, the investigator/institution should seek the written approval of the sponsor before proceeding with the disposal of these records. The minimum retention time will meet the strictest standard applicable to a particular site, as dictated by ICH GCP, any institutional requirements, applicable laws or regulations, or GSK standards/procedures; otherwise, the minimum retention period will default to 15 years.

The investigator/institution must notify GSK of any changes in the archival arrangements, including, but not limited to archival at an off-site facility, transfer of ownership of the records in the event the investigator leaves the site.

11.4. Quality assurance

To ensure compliance with GCP and all applicable regulatory requirements, GSK may conduct a quality assurance audit. Regulatory agencies may also conduct a regulatory inspection of this study. Such audits/inspections can occur at any time during or after completion of the study. If an audit or inspection occurs, the investigator and institution agree to allow the auditor/inspector direct access to all relevant documents and to allocate his/her time and the time of his/her staff to the auditor/inspector to discuss findings and any relevant issues.

11.5. Posting of information on publicly available clinical trial registers and publication policy

Study information from this protocol will be posted on publicly available clinical trial registers before enrolment of subjects begins.

Summaries of the results of GSK interventional studies (phase I-IV) are posted on publicly available results registers within 12 months of the primary completion date for studies of authorized vaccines and 18 months for studies of non-authorized vaccines.

GSK also aims to publish the results of these studies in the searchable, peer reviewed scientific literature. Manuscripts are submitted for publication within 24 months of the last subject’s last visit.

11.6. Provision of study results to investigators

Where required by applicable regulatory requirements, an investigator signatory will be identified for the approval of the study report. The investigator will be provided reasonable access to statistical tables, figures, and relevant reports and will have the

opportunity to review the complete study results at a GSK site or other mutually-agreeable location.

GSK Biologicals will also provide the investigator with the full summary of the study results. The investigator is encouraged to share the summary results with the study subjects, as appropriate.

12. COUNTRY SPECIFIC REQUIREMENTS

Not applicable.

APPENDIX B AMENDMENTS AND ADMINISTRATIVE CHANGES TO THE PROTOCOL

GlaxoSmithKline Biologicals Clinical Research & Development **Protocol Amendment 1**	
eTrack study number and Abbreviated Title	117119 (DTPA-HBV-IPV-135)
IND number	BB-IND 006687
EudraCT number	2013-004304-19
Amendment number:	Amendment 1
Amendment date:	Final: 18 September 2014
Co-ordinating author:	PPD, Scientific Writer

Rationale/background for changes:

- Clarification has been provided that large injection site reactions and measurement of the injected limb should be collected as a solicited symptom. Specific instructions regarding measurement of limb circumference and clinical details of large injection site reactions have been added.
- Additional minor clarifications of study procedures and data analyses have been made throughout the document.
- Instructions regarding interval between preparation and administration of vaccine has been aligned with the stability data described in the current Investigator Brochure.
- Due to ongoing re-validation of serological assays for antibodies to diphtheria and tetanus toxoids, pertussis antigens, poliovirus, hepatitis B surface antigen and polyribosyl ribitol phosphate, the cut-offs for these assays could potentially change and hence a note has been added in the protocol regarding this. The definition of booster response to pertussis antigens could also potentially be revised.
- Sequence of reporting the results has been clarified.
- The contributing authors and sponsor signatory were updated to reflect changes in the study team.

Amended text has been included in *bold italics* and deleted text in ~~strikethrough~~ in the following sections:

Primary study vaccine and number	GlaxoSmithKline (GSK) Biologicals' Combined Diphtheria-Tetanus-acellular Pertussis (DTaP), Hepatitis B, Poliovirus and *Haemophilus influenzae* type b vaccine (DTPa-HBV-IPV/Hib) (~~GSK~~ ***SB***217744, *Infanrix hexa*™).

Section 1.2.1 Rationale for the study

More than ~~73~~ ***100*** million doses have been distributed to date and the benefit/risk profile remains favorable.

α Child can still continue in the study if the mother does not wish to provide consent to record her Tdap vaccination history.

β Only the Tdap vaccination history (during the pregnancy of the enrolled child) from mothers who have given consent to provide this information will be obtained and recorded in the eCRF..

δ For the Penta group, which receives only one vaccine at Visit 5, baseline measurement of only the limb receiving the vaccine is required

* Refer to Section 8.1.3.1 ***and 5.6.2.9*** for detailed explanation on the reporting of large injection site reaction

Section 5.6.2.4 Vaccination history

The Tdap vaccination history of the mother during pregnancy will also be collected and recorded in the eCRF ***(provided that the mother has consented to provide this information).***

Note: Maternal vaccination is requested in order to be able to summarize the responses of the subjects to pertussis antigens according to whether or not the mothers received a pertussis vaccine during their pregnancy. This information will aid in understanding the effect of transplacentally transferred antibodies on the childs' immune response to vaccination.

Section 5.6.2.9.1 Blood sampling for immune response assessments

- A volume of approximately 5.0 mL of whole blood ~~(~~to provide approximately 1.7 mL of serum~~)~~ should be drawn from all subjects for the analysis of humoral immune response at Visits 4 and 5. At least 3.5 mL of whole blood ~~(~~to provide ~~atleast~~ ***approximately*** 1.2 mL of serum~~)~~ should be drawn from all subjects for the analysis of humoral immune response at Visit 6. After centrifugation, serum samples should be kept at –20°C/ –4°F or below until shipment. Refer to the SPM for more details on sample storage conditions.

Section 5.6.2.11 Baseline measurement of limb length and circumference after booster vaccination at visit 5

During Epoch 002, baseline measurement of length of limb(s) and circumference (arms or legs according to where the vaccine was administered) at the level of the injection site should be obtained. For the Penta group, baseline measurement is only required for the limb that will be vaccinated. Clothing should be removed so as not to interfere with the measurement of the length of the limb and the circumference. Upper arm length will be determined from the acromion process of the scapula to the tip of the elbow and thigh length will be determined from the midpoint of the abdomen thigh flexure crease and the proximal end of the patella. For measuring upper arm circumference, the measurement will be performed while the arm is held parallel to the trunk and the elbow is flexed in front at 90° (as if the subject is carrying a tray) [Kohl, 2007]. For measuring leg circumference the child should be standing or lying flat, as appropriate, as long as the leg is straight.

Section 5.6.2.13 Recording of AEs, SAEs and NOCDs

- ***During Epoch 002, following the fourth dose vaccination, the parents/LAR(s) should be provided with a measurement device for recording circumference of injected limbs (arms or legs according to where vaccine was administered) at the level of the injection site on the day of vaccination and during the next three days on a diary card. The parents/LAR(s) should be instructed on how and where to perform the measurement of the circumference of the vaccinated limb. Daily measurements should be performed in the same manner preferably by the same person and at the same time of day during the 4-day follow-up (Day 0-Day3) period.***
- ~~During Epoch 002,~~ ~~i~~***If*** the parent(s) /LAR(s) of infants observe any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of ~~arm~~ ***limb*** circumference) during the 4-day follow-up (Day 0-Day 3) period, they ~~will be asked~~ ***are*** to contact study personnel and to visit the investigator's office for evaluation as soon as possible ***and to bring the diary card with them.*** ~~. The investigator will record detailed information describing the AE on a specific large injection site reaction in the eCRF.~~
- ***In addition to the diameter of the swelling and the circumference of the limb that are reported as solicited symptoms, the parents(s)/LAR(s) will record the following additional symptoms/characteristics that may be associated with large injection site swelling reactions on the diary card:***
  - ***Type of swelling (local swelling only around the injection site, diffuse swelling not involving the elbow or knee joint, swelling involving the elbow or knee joint)***
  - ***Whether or not the diameter of the swelling involves more than 50% of the limb (baseline measurement of the length of the limb taken by study personnel at the vaccination visit will be provided on the diary cards)***
  - ***Induration at injection site (largest diameter)***
  - ***Pruritis at the injection site (intensity – scale provided)***
  - ***Functional impairment (intensity – scale and description provided)***
- ***The study personnel's evaluation will be recorded in the medical chart. In case the diary card score is not in line with the medical chart score, the medical chart will indicate what is the most intense score. The largest or most intense score for a given day will be recorded in the eCRF at the level of the solicited symptoms and at the level of the large swelling report form.***

Section 5.7.3 Laboratory assays

At Visits 4, 5 and 6, blood will be collected for measurement of immune response. Total blood volume to be taken from each subject over the study period is approximately 13.5 mL (approximately 5.0 mL of whole blood ***to provide approximately 1.7 mL of serum*** at Visits 4 and 5 and at least 3.5 mL of whole blood ***to provide approximately 1.2 mL of serum*** at Visit 6).

Section 6.1 Description of study vaccines

Table 9 Study vaccines

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Pentacel	DTaP-IPV (Sanofi Pasteur)	PT=20µg; FHA=20µg; FIM=5µg; PRN=3µg; DT=15Lf; TT=5Lf; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; PRP=10µg TT,TT=24µg; $AlPO_4$=330µg Al3+	Suspension for injection (0.5-mL dose) supplied as a liquid vaccine component in a single dose vial	0.5 mL*	4
	~~ActHIB~~ ***Hib***	~~Hib=10µg TT, TT=24µg~~ ***PRP=10µG; TT~=25µG***	~~White lyophilized pellet in a single dose vial, it must be reconstituted before use with the liquid DTaP- IPV component.~~ ***The lyophilized Hib component is presented as a white pellet in a glass vial; it must be reconstituted with the liquid DTaP-IPV component before use***		

Section 6.3 Dosage and administration of study vaccines

NOTE: After reconstitution, *Infanrix hexa* should be ~~administered promptly or stored refrigerated between 2° and 8°C and administered within 24 hours. If the vaccine is not administered promptly, shake the solution vigorously again before injection~~ ***injected immediately. However the vaccine may be kept for up to 8 hours at room temperature (21°C).***

Section 6.7.1 Recording of concomitant medications/products and concomitant vaccination

- Any concomitant vaccination administered ***since birth*** ~~in the period starting 30 days before the first dose of the study vaccine~~ and ending 30 days after the booster dose (Visit 6). ~~Notes: 1).~~ Vaccinations listed prior to the first dose of study vaccine are to be recorded as vaccination history. ~~2)~~ The fourth dose of *Prevnar 13* will be recorded as concomitant vaccination.

  * ***Refer to those*** SAEs that are required to be reported per protocol.

Section 8.1.3.1 Solicited local (injection-site) adverse events

Table 11 Solicited local adverse events

Pain at injection site
Redness at injection site
Swelling at injection site
Post-dose 4 measurements of circumference of limbs (arm or leg according to where vaccine was administered)

N.B. If parent(s) /LAR(s) of infants observe any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of ~~arm~~ ***limb*** circumference) after the booster dose at Visit 5, they ~~will be asked~~ ***are*** to contact study personnel and to visit the investigator's office for evaluation as soon as possible ***and bring the diary card with them***. The investigator will record detailed information describing the AE on a specific large injection site reaction ***form*** in the eCRF. ***In addition to the diameter of the swelling and the circumference of the limb that are reported as solicited symptoms the parent(s)/LAR(s) will need to record additional symptoms/characteristics as mentioned in Section 5.6.2.13.***

Note: local AEs will not be ~~collected~~ ***solicited*** for co-administered vaccines like *Prevnar 13* ~~and *Rotarix*.~~

Section 8.3.1 Time period for detecting and recording adverse events and serious adverse events

Note: With the exception of AEs/SAEs leading to withdrawal, study participation and concurrent GSK medications or vaccines, there is no reporting of SAEs from the time of the Epoch 1 ESFU phone contact and administration of dose 4 (approximately three months).

Section 8.3.3.2.1 Assessment of intensity

Table 14 Intensity scales for solicited symptoms in infants/toddlers

Infant/Toddler (15–24 months)		
Adverse Event	**Intensity grade**	**Parameter**
Pain at injection site	0	None
	1	Mild: Minor reaction to touch
	2	Moderate: Cries/protests on touch
	3	Severe: Cries when limb is moved/spontaneously painful
Redness at injection site		Record greatest surface diameter in mm
Swelling at injection site		Record greatest surface diameter in mm
Increase in limb circumference post-dose 4 (arm or leg according to where vaccine was administered)		***Record the limb circumference at the level of the injection site***

The maximum intensity of fever ~~was~~ ***will be*** scored at GSK Biologicals as follows:

0	=	***<100.4°F***	***<38.0°C***
1	=	***≥100.4°F to ≤102.2°F***	***≥38.0°C to ≤39.0°C***
2	=	***>102.2°F to ≤104.0°F***	***>39.0°C to ≤40.0°C***
3	=	***> 104.0°F***	***> 40.0°C***

Prior to analysis, the increase in limb circumference of each limb as compared to the baseline pre-vaccination measurement will be scored for each subject at GSK Biologicals' as follows:

Grade 0 = Increase in limb circumference ≤5 mm
1 = Increase in limb circumference >5 mm but ≤20 mm
2 = Increase in limb circumference >20 mm but ≤40 mm
3 = Increase in limb circumference >40 mm

For unsolicited symptoms and adverse events associated with large injection site reactions (e.g. pruritus, induration and functional impairment, t~~T~~he intensity should be assigned to one of the following categories:

Section 10.4.2 Primary ATP cohort for analysis of safety

- who have received all ***planned*** study vaccines ~~as planned~~ ***for each completed vaccination visit in*** ~~up to the end of~~ Epoch 001;

Section 10.4.5 Booster ATP cohort for analysis of safety

- who have received the ***planned*** booster dose at 15-18 months of age;

Section 10.5 Derived and transformed data

- A seropositive subject is a subject whose antibody concentration/titer is greater than or equal to the assay cut-off defined in Table 7.
  Note: Due to ongoing re-validation of all assays, these cut-offs may be subject to change.
- Booster responses for anti-PT, anti-FHA and anti-PRN antibodies are defined as:
  – For initially seropositive subjects with pre-booster antibody concentration ≥ 20 EL.U/mL with an increase of at least two times the pre-booster antibody concentration, one month after vaccination.

  Note: Due to ongoing re-validation of pertussis assays, the definition of booster responses may be subject to change.

Section 10.6.2.2 Between group assessment

- The 95% CI for each group GMC/GMT ratio will be computed using an Analysis of Variance (ANOVA) model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect ***and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model***.. For hepatitis B antigen, the hepatitis b at birth vaccine dose status will also be used as regressor ~~leading to an Analysis of Co-variance (ANCOVA) model~~.

Section 10.7.2.2 Between group assessments

- The 95% CI for each group GMC/GMT ratio will be computed using an ANOVA model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect ***and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model***. For hepatitis B antigen, the hepatitis B at birth vaccine dose status will also be used as regressor ~~leading to an ANCOVA model.~~

Section 10.8 Statistical methods

- The GMT/GMC group ratio will be obtained using an ANOVA model on the logarithm-transformed concentrations/titers. ***The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model.*** For hepatitis B antigen, the hepatitis B status at birth vaccine dose will also be used as regressor ~~leading to an Analysis of Co-variance (ANCOVA) model~~.

Section 10.9.1 Sequence of analyses

1. The final data analysis of Epoch 001 including all as clean as possible data, up to one month after the third primary vaccine dose, and some partial data from the ESFU contact will be conducted as soon as possible. This analysis will include the final analysis of immunogenicity and the final analysis of solicited symptoms for the primary vaccination course. ~~All analyses will be presented in Clinical Study Report (CSR). The CSR will be shared with the investigators.~~
2. All these analyses will be presented in a~~n Epoch 002 specific~~ ***final*** CSR. ~~The final CSR will be shared with the investigators.~~

Protocol Amendment 2

eTrack study number and Abbreviated Title	117119 (DTPA-HBV-IPV-135)
IND number	BB-IND 006687
EudraCT number	2013-004304-19
Amendment number:	Amendment 2
Amendment date:	Final Version 02: 17 April 2015
Co-ordinating author:	PPD , Scientific Writer

Rationale/background for changes:
The amendment 2 has been implemented to amend the following sections of the protocol:

- The assay for testing antibodies against polyribosyl ribitol phosphate (anti-PRP) has been re-developed but is not yet qualified or validated for testing the one month post dose-3 samples. This has been clarified in the protocol in Table 7 Humoral immunity (antibody determination) and Section 5.7.3 Laboratory assays.
- Investigator sign-off on the patient identification (PIDS) will be done after Visit 4 instead of extended safety follow-up (ESFU). In Table 4 List of study procedures, the bullets pertaining to investigator sign-off and analysis of Epoch 001 has been removed from the ESFU visit and retained at Visit 4 to reflect this change.
- The collection of baseline measurement of limb length has been removed since it will not be used in analysis; only limb circumference will be used in analysis. Accordingly, text related to this has been amended in Table 4 List of study procedures, Sections 5.6.2.11, Baseline measurement of limb circumference after booster vaccination at visit 5 and 5.6.2.13 Recording of AEs, SAEs and NOCDs.
- Errors in the vaccines dictionary of Study Master Repository (SMR) have been rectified for *Infanrix hexa*, *Pediarix* and *Pentacel* vaccines. The corresponding correction has been made in Table 9 Study vaccines.
- The sequence of analysis in Section 10.9.1 Sequence of analyses, has been amended to reflect that there will first be an analysis of immunogencity for anti-PRP and safety for Epoch 001, followed by a final analysis covering both Epochs at the end of the study.

Amended text has been included in *bold italics* and deleted text in ~~strikethrough~~ in the following sections:

Section 5.5 Outline of study procedures:
Table 4 List of study procedures

	EPOCH 001 (PRIMARY VACCINATION)					EPOCH 002 (BOOSTER VACCINATION)

Investigator sign-off				●	~~●~~		●
Analysis of the Epoch 001 #				O	~~O~~		

In Section 5.6.2.11 Baseline measurement of limb circumference after booster vaccination at visit 5

In Section 5.6.2.11 Baseline measurement of limb ~~length and~~ circumference after booster vaccination at visit 5

During Epoch 002, baseline measurement of ~~length of~~ limb~~(s) and~~ circumference (arms or legs according to where the vaccine was administered) at the level of the injection site should be obtained. For the Penta group, baseline measurement is only required for the limb that will be vaccinated. Clothing should be removed so as not to interfere with the measurement of the ~~length of the~~ limb ~~and the~~ circumference. ~~Upper arm length will be determined from the acromion process of the scapula to the tip of the elbow and thigh length will be determined from the midpoint of the abdomen thigh flexure crease and the proximal end of the patella.~~

In Section 5.6.2.13 Recording of AEs, SAEs and NOCDs:

- ~~Whether or not the diameter of the swelling involves more than 50% of the limb (baseline measurement of the length of the limb taken by study personnel at the vaccination visit will be provided on the diary cards).~~

In Section 5.7.3 Laboratory assays

All serology will be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized ~~validated~~ procedures with adequate controls. ***All serology for primary endpoints will be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized, validated procedures with adequate controls.***

GlaxoSmithKline Biologicals, SA

Study detailed title

A Phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' *Infanrix hexa* vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with *Prevnar* and *Rotarix* with a booster dose of GSK Biologicals' *Infanrix* and *Hiberix* vaccines at 15-18 months of age.

Clinical Study Report for Study 117119 (DTPA-HBV-IPV-135)

Development Phase III

IND Number: BB-IND 006687

EUDRACT Number: 2013-004304-19

Name of Investigational Product: GlaxoSmithKline (GSK) Biologicals' Combined Diphtheria-Tetanus-acellular Pertussis (DTaP), Hepatitis B, Poliovirus and *Haemophilus influenzae* type b vaccine (DTPa-HBV-IPV/Hib) (SB217744, *Infanrix hexa*).

Indication Studied: Active immunization against diphtheria, tetanus, pertussis infection caused by all known subtypes, of hepatitis B virus, poliomyelitis, and invasive disease caused by *Haemophilus influenzae* type B (Hib) in infants.

Study initiation date:	16-April-2014
Study completion date:	13-November-2015
Data lock point (Date of database freeze):	15-March-2018
Date of report:	Final: 06-July-2018
Earlier Study Reports Abridged Interim Report	19-October-2015

Sponsor Signatory: Narcisa Mesaros, MD,
Clinical and Epidemiology R&D Project Leader,
DTP, Polio and Hib containing vaccines –
R&D Centre Belgium, GlaxoSmithKline Biologicals.

This study was performed according to the principles of GCP including the archiving of essential documents.

Based on GSK Biologicals' Study Report INS-BIO-CLIN-1010 v05

SYNOPSIS

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

Study No.: 117119 (DTPA-HBV-IPV-135)

Title of the study:
A Phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' *Infanrix hexa* vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co administered with *Prevnar* and *Rotarix* with a booster dose of GSK Biologicals' *Infanrix* and *Hiberix* vaccines at 15-18 months of age.

Investigator(s) and study centre(s):
Multicenter study conducted in 43 centers in the United States of America (USA).
Principal investigator: Dr Nicola Klein, M.D. at the Kaiser Permanente Oakland, One Kaiser Plaza, Oakland, CA, USA.

Publication (reference): None at the time of this report

Study period: **Study initiation date:** 16-April-2014 **Study completion date:** 13-November-2015 **Data lock point (Date of database freeze):** 15-March-2018	**Phase:** Phase III

Indication: Active immunization against diphtheria, tetanus, pertussis infection caused by all known subtypes, of hepatitis B virus, poliomyelitis, and invasive disease caused by *Haemophilus influenzae* type B (Hib) in infants.

Objectives:

Primary: **Epoch 001 (Primary vaccination):**

- To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens [pertussis toxoid (PT), filamentous haemagglutinin (FHA) and pertactin (PRN)] one month after the third dose of the primary vaccination.

  Criteria for non-inferiority:

  Non-inferiority in terms of immune response to pertussis antigens was to be demonstrated if, for each of the three antigens, the upper limit (UL) of the 95% confidence interval (CI) on the GMC ratio [Pedia divided by Hexa] was ≤ 1.5.

Secondary: **Epoch 001 (Primary vaccination)**

- To assess the immune response to *Infanrix hexa*, *Pediarix*, *ActHIB*, *Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to D (Diphtheria), T (Tetanus), HBs (Hepatitis B surface antigen), pertussis, poliovirus types 1, 2 and 3 and PRP (Polyribosyl-Ribitol-Phosphate) antigens, one month after the third dose of the primary vaccination.
- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa*, of *Pentacel* co-administered with *Engerix-B*, and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events, new-onset chronic illnesses (NOCIs; referred to as new-onset chronic diseases (NOCDs) in the protocol) and serious adverse events.

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

Secondary: **Epoch 002 (Booster vaccination)**

- To assess the immunogenicity of *Infanrix hexa*, *Pentacel*, *Engerix-B*, *Pediarix* and *ActHIB*, in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.
- To assess the immune response to *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*, in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix* and *Pentacel*, one month after the booster dose.
- To assess the safety and reactogenicity of booster doses of *Infanrix, Hiberix, ActHIB* and *Pentacel*.

Methodology:

- Experimental design: Phase III, open-label, randomized, controlled, multi-centric, single-country study with five parallel groups.
  - **Epoch 001**: Primary, starting at Visit 1 (Day 0) and ending at safety follow up contact (i.e. six months following the third dose, Month 10);
  - **Epoch 002**: Booster, starting at Visit 5 (Month 13-16) and ending at Visit 6 (Month 14-17).
- Control: active controls.
  - Epoch 001: *Pediarix* + *ActHIB* and *Pentacel* + *Engerix-B*;
  - Epoch 002: *Infanrix* + *ActHIB* and *Pentacel*.

Vaccination schedules:

<u>*Epoch 001*</u>

- **Hexa Group**: Subjects in this group were to receive three doses of *Infanrix hexa* (lot A, lot B or lot C as per the group allocation) co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
  - Hexa_1 Group: Subjects were to receive lot A of *Infanrix hexa*;
  - Hexa_2 Group: Subjects were to receive lot B of *Infanrix hexa;*
  - Hexa_3 Group: Subjects were to receive lot C of *Infanrix hexa*.
- **Pedia Group:** Subjects in this group were to receive three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
- **Penta Group:** Subjects in this group were to receive three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
- *Subjects in the Penta Group who received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination were not to receive *Engerix-B* at 4 months of age (Visit 2).

<u>*Epoch 002*</u>

- **Hexa Group:** Subjects were to receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.
- **Pedia Group:** Subjects were to receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.
- **Penta Group:** Subjects were to receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

The fourth dose of pneumococcal conjugate vaccine is recommended to be administered at approximately 12-15 months of age. Since the booster dose of the candidate vaccine/active controls were given in this study at 15-18 months of age, the fourth dose of *Prevnar13* was not to be administered as part of the study protocol. Subject's parent(s)/Legally Acceptable Representative(s) (LARs) were to be reminded at Visit 3 and Visit 4 to consult their primary health care provider regarding the fourth dose of *Prevnar13* at 12-15 months for their child.

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

- As the analyses were to be performed regardless of the lot of *Infanrix hexa* received, unless otherwise specified, the Hexa_1, Hexa_2 and Hexa_3 groups were pooled together for the analysis and were called the Hexa group.
- Treatment allocation: The subjects were randomized at a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. This was done at study entry using GSK Biologicals' central randomization system on internet (SBIR).
- Blinding: The study was open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing was blinded to the treatment, and codes were used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.
- Sampling schedule: Blood samples were drawn from all subjects at the following time points:
  - Post-Pri (Visit 4): One month after the third dose of primary vaccination, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) was collected.
  - Pre-Bst (Visit 5): Before the administration of the booster dose, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) was collected.
  - Post-Bst (Visit 6): One month after the booster vaccination, a volume of at least 3.5 mL of whole blood (to provide at least 1.2 mL of serum) was collected.
- Type of study: self-contained.
- Data collection: electronic Case Report Form (eCRF).

Study vaccine, dose, mode of administration, lot no.:
Vaccination schedule /site: See Vaccination schedules for the Hexa group in Epoch 001 and Epoch 002 in Methodology section above. Injections of *Infanrix hexa, Infanrix, Hiberix* and *Prevnar13* were via intramuscular injection in the thigh, with *Rotarix* given orally.

Vaccine composition /dose /lot number: AC21VB448C and AHIBC950C (Infanrix hexa Lot A);
AC21B514A and AHIBC907D (Infanrix hexa Lot B);
AC21B510B and AHIBC954A (Infanrix hexa Lot C); AC14B195A (*Infanrix*);

Reference vaccine /Comparator, dose and mode of administration, lot no.:
Vaccination schedule /site: See Vaccination schedules for the Pedia and Penta groups in Epoch 001 and Epoch 002 in Methodology section above. Injections of *Pediarix, ActHIB, Pentacel, Engerix-B* and *Prevnar13* were via intramuscular injection in the thigh, with *Rotarix* given orally.

Vaccine composition /dose /lot number: AC21VB448C (*Pediarix*); AHBVC253A (*Engerix-B*); AROTVA291D and AD05VA833A (*Rotarix*);
First Pentacel Lot: Lot no. DLOCA102AY (Alternative Lot no. C4507AA), Lot no. DLOCA102AZ (Alternative Lot no. C4557AA); Second Pentacel Lot: Lot no. DLOCA108AY (Alternative Lot no. C4517BA), Lot no. DLOCA108AZ (Alternative Lot no. C4574AA);

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

Third Pentacel Lot: Lot no. DLOCA144AY (Alternative Lot no. C4724AA), Lot no. DLOCA144AZ (Alternative Lot no. C4642AA);
Lot no.: DLOCA106AZ (Alternative Lot no. UH971AA), DLOCA150AZ (Alternative Lot no. UI117AA; only for Epoch 2; *ActHIB*); Lot no.: DLOCA106AY (Alternative Lot no. UH954AB), DLOCA150AY (Alternative Lot no. UI128AA; only for Epoch 2; *ActHIB*);
DLOCA107A (Alternative Lot no. H39264; *Prevnar13*)

Study Population: Healthy male and female infants, between and including, 6 and 12 weeks of age at the time of the first dose who were free of obvious health problems, born full-term after a gestation period of 37 weeks to less than 42 completed weeks and who had not received vaccination against diphtheria, tetanus, pertussis, *Haemophilus influenzae* type b, rotavirus, pneumococcus, and/or poliovirus; or more than one previous dose of hepatitis B vaccine administered at least 30 days prior to enrolment. Written informed consent was obtained from the parent/guardian of the subject prior to any study-related activity.

Duration of treatment: The intended duration of the study per subject is approximately 14-17 months.

Criteria for evaluations:

Primary endpoint: Epoch 001 (Primary vaccination)

- Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.

Secondary endpoints: Epoch 001 (Primary vaccination)

- Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa, Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*.
  - Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3 and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after each vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited adverse events (AEs) within 31 days (Day 0 – Day 30) after each vaccination, according to the Medical Dictionary for Regulatory Activities (MedDRA) classification.

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic illnesses (NOCI; e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.
- Serious adverse events (SAEs).
  - Occurrence of serious adverse events from Day 0 up to six months post primary vaccination.

Secondary endpoints: Epoch 002 (Booster vaccination)

- Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1.0 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1.0 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Infanrix*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1.0 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix*.
  - Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1.0 µg/mL one month after the booster dose (Dose 4)
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after booster vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after booster vaccination, according to the MedDRA classification.
- Serious adverse events (SAEs).
  - Occurrence of serious adverse events from the booster dose up to one month after the booster vaccination.

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

Statistical methods: Final analysis of the Epoch 001

Analysis of demographics

Demographic characteristics (age [weeks], gender, geographical ancestry, height in length [cm], weight [kg] at first dose, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status were summarised by group using descriptive statistics:

- Frequency tables were generated for categorical variables such as center;
- Mean, median and standard error were provided for continuous data such as age.

The distribution of subjects enrolled among the study sites was tabulated as a whole and per group.

Analysis of immunogenicity

The primary analysis was based on the Primary according-to-protocol (ATP) cohort for immunogenicity. An analysis on the Primary Total Vaccinated cohort (TVC) was performed only if, in any vaccine group and at any time point, more than 5% of the vaccinated subjects with immunological data post-dose 3 were excluded from the Primary ATP cohort for immunogenicity.
The following sections describe the analyses that were performed.

Within group assessment

For each group, one month post-dose 3 and for each assay for which a serological result was available:

- Seropositivity and seroprotection rates with exact 95% CIs were calculated.
- GMCs/geometric mean titers (GMTs) with 95% CIs were tabulated.
- For each antigen, antibody concentration or titer distribution one month post-vaccination was tabulated and displayed using reverse cumulative curves (RCCs).
- For anti-PRP post primary vaccinate at Visit 4, seropositivity and seroprotection rates and GMCs were calculated per *Infanrix hexa* lot.

All the above within group analysis for Epoch 001, except the reverse cumulative curves (RCCs) and the presentation per *Infanrix hexa* lot, were also to be performed by gender, by geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry), by Tdap vaccination history of mothers during pregnancy and by Hepatitis B vaccination of the subjects at birth (for anti-HBs antigen).

Between group assessment

At one month post-dose 3,

- The asymptotic standardized 95% CI for the group difference (Pedia group minus Hexa group and Penta group minus Hexa group) in the seroprotection rates was computed for each antigen.

Antigen	Threshold considered for protection
• Anti-D	• 0.1 IU/mL (short term protection) • 1.0 IU/mL (long term protection)
• Anti-T	• 0.1 IU/mL (short term protection) • 1.0 IU/mL (long term protection)
• Anti-polio	• 8 dilution
• Anti-PRP	• 0.15 µg/mL (short term protection) • 1.0 µg/mL (long term protection)
• Anti-HBs	• 10 mIU/mL

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

- The 95% CI for each group GMC/GMT ratio (Pedia group divided by Hexa group and Penta group divided by Hexa group) was computed using an Analysis of Variance (ANOVA) model on the logarithm-transformed concentrations/titers. The ANOVA model was to include the vaccine group as fixed effect and the Tdap vaccination of the mother during pregnancy as continuous regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B vaccine birth dose status was also to be used as regressor leading to an ANCOVA model. The model was to include the data from the 3 groups compared. For analysis purpose, DTP vaccination of the mother during pregnancy and Hepatitis B vaccination at birth were considered as continuous variables. More specifically 2 continuous indicator variables were to be used for Tdap vaccination of mother during pregnancy (an indicator for no Tdap vaccination at birth and an indicator for unknown vaccination at birth) while one indicator of hepatitis B vaccination at birth was used.

Interpretation of analyses

Except for analyses addressing criteria specified in the primary objective, comparative analyses were descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses were not to be interpreted for formal conclusions since there was no adjustment for multiplicity of endpoints.

Analysis of safety

The primary analysis was based on the primary Total Vaccinated cohort. If, in any vaccine group and at any time point of the Epoch 001, the percentage of vaccinated subjects excluded from the primary ATP cohort for safety was more than 5%, a second analysis based on the primary ATP cohort for safety was to be performed to complement the primary Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) or 31-day (Days 0-30) follow-up period was tabulated after each vaccine dose and overall (for the Epoch 001) with exact 95% CI.
- The percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 4-day or 31-day follow-up period was tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses with local AEs (solicited and unsolicited) were calculated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines, as well as overall (all sites considered) during the 4-day follow-up period was tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses reporting each individual solicited local and general AE during the 4-day follow-up period were tabulated for each group as follows:
  - Over the primary doses, the percentage of subjects with the symptom and its exact 95% CI.
  - Over the primary doses, the percentage of doses with the symptom and its exact 95% CI.
  - At each study dose, the percentage of subjects with the symptom and its exact 95% CI.

  The exact 95% CIs were calculated assuming independence between doses.

- All computations mentioned above were done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit. The percentage of subjects/doses reporting each individual solicited local symptom (any grade, grade 2, grade 3, medical advice) during the 4-day follow-up period were also to be tabulated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines with exact 95% CI after each vaccine dose and overall where the same row on the table was used for all vaccines given at the same site across the three study groups (e.g. *Infanrix hexa*, *Pentacel* and *Pediarix* together were in one row and *ActHIB* and *Engerix-B* together were in one row). The percentage of subjects/doses reporting each individual general solicited symptom (any grade, Grade ≥2, Grade 3,

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

causally related, Grade 3 causally related, medical advice) during the 4-day follow-up period were also to be tabulated with exact 95% CI. For fever, the analyses were also to be performed by 0.5°C increments.

- The percentage of subjects/doses with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination was tabulated after each dose and over the Epoch 001.
- The verbatim reports of unsolicited AEs were reviewed by a Clinical Research and Development Lead (CRDL) and the signs and symptoms were coded according to MedDRA. Every verbatim term was matched with the appropriate Preferred Term. The percentage of subjects/doses with unsolicited AEs occurring within 31 days with exact 95% CI was tabulated by Preferred Term. Similar tabulations were done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.
- Subjects who experienced AEs of specific interest (i.e. convulsions, Hypotonic Hyporesponsive Episode) during 31 days with exact 95% CI were tabulated by Preferred Term. Similar tabulations were done for AEs considered related to vaccination. Subjects who experienced AEs of specific interest were also to be described in detail.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to 6 months after the last primary vaccination were tabulated by Preferred Term.
- Subjects who experienced at least one SAE with onset from Dose 1 up to six months post primary vaccination were tabulated with MedDRA primary preferred term.
  - All analyses of reactogenicity and for unsolicited symptoms were also to be performed by gender and geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry).

Statistical methods: Final analysis of the Epoch 002

Analysis of demographics/baseline characteristics

Demographic characteristics (age [months] at Visit 5, gender, geographical ancestry, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status were summarized by group using descriptive statistics:

- Frequency tables were generated for categorical variables such as race/ethnicity;
- Mean, median and standard error were provided for continuous data such as age.

Analysis of immunogenicity

The primary analysis was based on the booster ATP cohort for immunogenicity. An analysis on the booster Total Vaccinated cohort was to be performed only if, in any vaccine group and at any time point of the Epoch 002, more than 5% of the vaccinated subjects with immunological data were excluded from the booster ATP cohort for immunogenicity.

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

The following section describes the analyses that were performed.

Within group assessment

For each group, prior to the booster dose and one month post-booster dose and for each assay, for which a serological result was available:

- Seropositivity and seroprotection rates and, for pertussis, booster response rates were calculated with exact 95% CIs.
- GMCs/GMTs with 95% CIs were tabulated.
- For each antigen, antibody concentration or titer distribution before and one month Post-booster (when available) were tabulated and displayed using RCCs.

All the above within group analysis for Epoch 002 except the reverse cumulative curves were also to be performed by gender, by geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry), by Tdap vaccination history of mothers during pregnancy and Hepatitis B vaccination of the subjects at birth (for anti-HBs antigen).

Between group assessment

At pre-booster and at one month post-booster,

- The asymptotic standardized 95% CI for the group difference (Pedia group minus Hexa group and Penta group minus Hexa group) in the seroprotection rates were computed for each antigen.

Antigen	Threshold considered for protection
• Anti-D	• 0.1 IU/mL (short term protection) • 1.0 IU/mL (long term protection)
• Anti-T	• 0.1 IU/mL (short term protection) • 1.0 IU/mL (long term protection)
• Anti-polio (Pre-Booster)	• 8 dilution
• Anti-PRP	• 0.15 µg/mL (short term protection) • 1.0 µg/mL (long term protection)
• Anti-HBs (Pre-Booster)	• 10 mIU/mL

- The 95% CI for each group GMC/GMT ratio (Pedia group divided by Hexa group and Penta group divided by Hexa group) were computed using an ANOVA model on the logarithm-transformed concentrations/titers. The ANOVA model was to include the vaccine group as fixed effect and the Tdap vaccination of the mother during pregnancy as regressor leading to an ANCOVA. For hepatitis B antigen, the hepatitis B vaccine birth dose status was also to be used as regressor leading to an ANCOVA model. The model was also to include the data from the 3 groups compared. For analysis purpose, DTP vaccination of the mother during pregnancy and Hepatitis B vaccination at birth were considered as continuous variables. More specifically 2 continuous indicator variables were used for Tdap vaccination of mother during pregnancy (an indicator for no Tdap vaccination at birth and an indicator for unknown vaccination at birth) while one indicator of hepatitis B vaccination at birth was used.

Interpretation of analyses

In Epoch 002, all comparative analyses were descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses were not to be interpreted for formal conclusions since there was no adjustment for multiplicity of endpoints.

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

Analysis of safety

The primary analysis for the Epoch 002 was based on the booster Total Vaccinated cohort and was only to look at the booster dose. If, in any vaccine group, the percentage of vaccinated subjects excluded from the booster ATP cohort for safety was more than 5%, a second analysis based on the booster ATP cohort for safety was to be performed to complement the booster Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period after the booster dose, were tabulated with exact 95% CI for each group.
- The incidence of local AEs (solicited and unsolicited) was calculated at each injection site as well as overall (all sites considered) for each group during the 4-day (Days 0-3) follow-up period after the booster dose.
- The percentage of subjects reporting each individual solicited local and general AE during the 4-day follow-up period was tabulated with its exact 95% CI for each group.
- All computations mentioned above were to be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit. The percentage of subjects reporting each individual solicited local symptoms (any grade, Grade ≥2, Grade 3, medical advice) during the 4-day follow-up period were also to be tabulated at each injection site for *Infanrix, Hiberix, ActHIB* and *Pentacel* vaccines with exact 95% CI after each vaccine dose and overall where vaccination with same vaccine site was considered together (e.g. *Infanrix* and *Pentacel* together were on one row and *ActHIB* and *Hiberix* together were on one row). The percentage of subjects reporting each individual general solicited symptom (any grade, Grade ≥2, Grade 3, causally related, Grade 3 causally related, medical advice) during the 4-day follow-up period was also to be tabulated with exact 95% CI. For fever, analyses were also to be performed by 0.5°C increments.
- The percentage of subjects with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination were tabulated for each group.
- The verbatim reports of unsolicited AEs were reviewed by a Clinical Research and Development Lead and the signs and symptoms were coded according to MedDRA. Every verbatim term was matched with the appropriate Preferred Term. The percentage of subjects with unsolicited AEs occurring within 31 days following the booster dose with its exact 95% CI was tabulated by Preferred Term. Similar tabulations were done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.

Additionally,

- Any large injection site reaction (defined as a swelling with a diameter > 50 mm, noticeable diffuse swelling or increase in limb circumference of greater than 50 mm) reported within 4 days (Days 0-3) following the booster dose was to be tabulated.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from booster dose up to one month after booster vaccination were tabulated by Preferred Term.

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

- Subjects who experienced at least one SAE from the booster dose up to one month after were tabulated with MedDRA primary preferred term. The same summary was provided for all SAEs reported after dose 1 up to study end.

All analyses of reactogenicity and for unsolicited symptoms were also to be performed by gender and geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestry, namely White Caucasian versus any other geographical ancestry).

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
Booster response to PT, FHA and PRN antigens is defined as:
ubjects: For subjects with pre-vaccination antibody concentration below the assay cut off, post-vaccination antibody concentration ≥ 4 times the assay cut-off
<4*cut_off IU/mL) subjects: For subjects with pre-vaccination antibody concentration between the assay cut off and below 4 times the assay cut-off, post-vaccination antibody concentration equal or above 4 times the pre-vaccination antibody concentration
S+ (≥4*cut_off IU/mL) subjects: For subjects with pre-vaccination antibody concentration equal or above 4 times the assay cut off,

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

post-vaccination antibody concentration equal or above 2 times the pre-vaccination antibody concentration
N = number of subjects with pre- and post-vaccination results available
n/% = number/percentage of subjects with booster response
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
Note: The assay cut off is 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA, and 2.187 IU/mL for anti-PRN.

Synopsis Table 10 - Number and percentage of subjects with anti-D and anti-T antibody concentration equal to or above the assay cut-off, 0.1 IU/mL and 1.0 IU/mL and geometric mean concentration (GMC), before and one month post booster vaccination (Booster ATP cohort for immunogenicity)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
GMC = geometric mean antibody concentration calculated on all subjects
N = number of subjects with available results
n/% = number/percentage of subjects with concentration equal to or above specified value
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
PRE-BST = Pre booster vaccination at Month 13-16 (Visit 5)

Summary:

Immunogenicity results: Primary Vaccination Epoch

- The primary objective to demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody GMCs for pertussis antigens (PT, FHA and PRN) one month after the third dose of the primary vaccination was reached:
  - For PT, FHA and PRN, the upper limit of the 95% CI for the GMC ratio [Pedia group divided by Hexa group] was ≤ 1.5: For anti-PT antibody – 1.31; for anti-FHA antibody – 1.35; for anti-PRN antibody – 0.99 (Synopsis Table 2).
- *Anti-Diphtheria and anti-Tetanus antibody responses:* All subjects had anti-D antibody concentrations ≥ 0.1 IU/mL and at least 99.3% of subjects had anti-T antibody concentrations ≥ 0.1 IU/mL, indicating seroprotection against these diseases (Synopsis Table 4).
- *Anti-Polio 1, 2, and 3 antibody responses:* At least 99.3% of subjects had anti-Polio 1 antibody titer ≥8, all subjects had anti-Polio 2 antibody titer ≥8 and at least 98.4% of subjects had anti-Polio 3 antibody titer ≥8 (Synopsis Table 5).
- *Anti-PRP antibody responses:* Short-term seroprotection against *Haemophilus influenzae* type b disease (anti-PRP antibody concentrations ≥ 0.15 μg/mL) was met by at least 94.8% across groups using the fully validated assay (Synopsis Table 6).
- *Anti-HBs antibody responses:* Seroprotection against Hepatitis B virus (HBV) disease (anti-HBs ≥ 10 mIU/mL) was reached by at least 97.8% of subjects across the groups (Synopsis Table 7).

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

Immunogenicity results: Booster Vaccination Epoch

- The proportion of subjects with an anti-Pertussis antibody booster response was:
  For anti-PT antibody: ≥93.1% across groups; for anti-FHA antibody: ≥97.7% across groups;
  for anti-PRN antibody: ≥97.4% across groups.
- *Anti-D and Anti-T immune response:* Seroprotection (≥ 0.1 IU/mL) was reached for at least 99.2% of subjects across groups and long-term seroprotection (antibody concentrations ≥1.0 IU/mL) was reached by all subjects for anti-D and for anti-T antibody by between 97.8-100% of subjects (Synopsis Table 10).
- *Anti-PRP immune response:* Short-term seroprotection (≥ 0.15 μg/mL): Between 98.5-100% of subjects across groups and long-term seroprotection (≥ 1.0 μg/mL) for between 97.7-99.3% of subjects across groups.

Safety results:

Primary Total vaccinated cohort - Safety summary

- *Any Symptom:* In all three groups (Hexa, Pedia and Penta) over the primary doses, symptoms (solicited and/or unsolicited, local and/or general) were reported for 93.4-96.4% of subjects.
- *Solicited local symptoms:* Pain was the most frequently reported solicited local symptom reported in 67.9% of subjects in the Hexa group, in 82.0% of subjects in the Pedia group and in 79.8% of subjects in the Penta group.
- Pain was also the most frequently reported Grade 3 solicited local symptom reported in 4.3% of subjects in the Hexa group, 18.0% of subjects in the Pedia group and 11.7% of subjects in the Penta group.
- Solicited *general symptoms:* Irritability / Fussiness was the most frequently reported solicited general symptom in all groups, reported in 87.7% of subjects in the Hexa group, in 96.3% of subjects in the Pedia group and in 94.1% of subjects in the Penta group overall.

  Irritability was also the most commonly reported grade 3 solicited general symptom, reported for 9.6% of subjects in the Hexa group, 18.5% of subjects in the Pedia group and 16.0% of subjects in the Penta group overall.
- *Unsolicited adverse events:* At least one unsolicited symptom within the 31-day post-vaccination period after each vaccination was reported for 57.9%, 55.7% and 49.0% of subjects in the Hexa, Pedia and Penta groups, respectively.

  The most commonly reported unsolicited symptom in the three groups was Upper Respiratory Tract Infection (URTI): Hexa group: 15.4%; Pedia group: 11.9%; Penta group: 13.3%.

  Grade 3 unsolicited symptoms were reported for 6.7%, 6.2% and 3.6% of subjects in Hexa, Pedia and Penta groups, respectively. The most commonly reported grade 3 unsolicited symptoms were: Hexa group: URTI and Otitis media (1.5%);
  Pedia group: URTI, Conjunctivitis and Irritability (1.0%);
  Penta group: URTI (1.0%).
- *Adverse events of interest:* New Onset of Chronic Illness (NOCI) symptoms were reported for 7 subjects (3.6%) in the Hexa group, 11 subjects (5.7%) in the Pedia group and 10 subjects (5.1%) in the Penta group. The two reported symptoms in the Hexa group were Dermatitis atopic (2.6%) followed by Bronchial hyperreactivity (1.0%). In the Pedia group, the symptom reported by more than one subject was Dermatitis atopic (3.6%). In the Penta group, the symptoms reported by more than one subject were Dermatitis atopic (3.6%) and Asthma (1.0%).

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

- *Serious adverse events:* Non-fatal SAEs from Dose 1 up to 6 months following priming doses were reported for 7 (3.6%) subjects in the Hexa group and Penta group, and 1 (0.5%) subject in the Pedia group. All SAE were considered recovered/resolved without sequelae at the end of the study except one non-causally related event of Choking in a 47-week-old female in the Hexa group which was considered recovered/resolved with sequelae.

  Three SAEs occurring in two subjects were considered causally related to primary vaccination by the investigator: An SAE of Lethargy in an 8-week-old female subject in the Hexa group which recovered/resolved after one day without sequelae; 2 SAEs in the same subject: one "Apparent life-threatening event" and one event of Leukocytosis were observed in a 10-week-old female subject in the Hexa group which recovered/resolved over 1-2 days without sequelae.

- No fatal SAEs were reported during the primary vaccination Epoch of the study.

- *Withdrawals due to AEs /SAEs:* Two subjects had adverse events leading to premature discontinuation during the primary vaccination period: one Hexa group subject with an SAE of Lethargy reported after the first vaccination; one Penta group subject with a Non-Serious Adverse Event of Seizure reported after the Month 2 dose.

Booster Total vaccinated cohort - Safety summary

- *Any Symptom:* At least one solicited or unsolicited symptom was reported during the Booster phase for 77.2% of Hexa group subjects, 81.6% of Pedia group subjects and 70.2% of Penta group subjects.

- *Solicited local symptoms:* Pain was the most frequently reported solicited local symptom reported in 46.8% of subjects in the Hexa group, 51.0% of Pedia group subjects and 39.3% of Penta group subjects.

  Redness was the most frequently reported Grade 3 solicited local symptom reported in 1.3-5.2% of subjects in the three groups.

- *Solicited general symptoms:* Irritability / Fussiness was the most frequently reported solicited general symptom in all the groups, reported in 56.2% of Hexa group subjects, in 62.7% of Pedia group subjects and in 50.3% of Penta group subjects.

  Irritability / Fussiness was also the most commonly reported grade 3 solicited general symptom reported for between 2.0 and 2.7% of subjects across groups.

- *Unsolicited adverse events:* At least one unsolicited symptom within the 31-day post-vaccination period after the booster vaccination was recorded for 22.2%, 22.2% and 25.5% of subjects in the Hexa, Pedia and Penta groups, respectively.

  The most commonly reported unsolicited symptoms were:
  Hexa group: Pyrexia (3.0%); Pedia group: Pyrexia, Otitis media and URTI (3.2%);
  Penta group: URTI (5.0%).

  A grade 3 unsolicited symptom was reported for 3.0%, 1.9% and 1.9% of subjects in Hexa, Pedia and Penta groups, respectively. No grade 3 unsolicited symptom was reported by more than one subject in any group.

- *Adverse events of interest:* NOCI were reported for 4 subjects (2.4%) in the Hexa group, 1 subject (0.6%) in the Pedia group and 1 subject (0.6%) in the Penta group. Only Seasonal allergy symptoms were reported by more than one subject in any group: 3 (1.8%) subjects.

Name of company: GlaxoSmithKline Biologicals (GSK), SA, Rixensart, Belgium	**Name of finished product:** *Infanrix hexa* vaccine	**Name of active substance:** Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine

- *Large injection site reactions up to 4 days (D0-D3) after vaccination:* Two subjects (1.3%) in the Hexa group and one subject (0.7%) in the Pedia group had Local Swelling, and Diffuse Swelling was recorded in one subject (0.6%) in the Hexa group.
- *Serious adverse events within 31 days post booster:* Non-fatal SAEs within 31 days post-booster dose were reported for one (0.6%) subject in the Hexa group (Petechiae), for one (0.6%) subject in the Penta group (Seizure like phenomena), and no subject in the Pedia group. None of the two non-fatal SAEs were considered to be causally-related to vaccination and both were recorded to have an outcome of "recovered/resolved".
- *Withdrawals due to AEs /SAEs:* No subject was withdrawn due to an AE or SAE during the booster Epoch.
- ***SAEs for the full study***: There were no fatal SAEs throughout the study. SAEs were reported for 8 subjects in *the* Hexa group and Penta group, and for one subject in the Pedia group throughout the study.

Conclusion:

- The primary objective of the study was met: One month post-primary vaccination, *Infanrix hexa* was demonstrated to be non-inferior to *Pediarix+ACTHib* in terms of antibody GMCs for the three pertussis antigens (PT, FHA, and PRN).
- *One month after the primary vaccination:* The immune responses to *Infanrix hexa*, *Pediarix+ACTHib* and *Pentacel*/*Engerix-B* were similar between the different groups, in terms of seroprotection/seropositivity rates and GMCs.

  The lowest anti-PRP GMCs were observed after *Infanrix hexa* vaccination as compared to *Pediarix+ACTHib* and *Pentacel+Engerix-B*.
- *One month after the booster vaccination:* The immune responses to *Infanrix+Hiberix* (booster vaccines used after *Infanrix hexa* priming), *Infanrix+ActHIB* (booster vaccines used after *Pediarix+ActHIB* priming) and *Pentacel* were similar between the different groups, in terms of seroprotection/seropositivity rates and GMCs.

  Similar Anti-PRP long-term protection antibody levels were observed (≥1.0 µg/mL) between *Infanrix+Hiberix*, *Infanrix+ActHIB* and *Pentacel* after booster vaccination.
- *Safety, reactogenicity:* Clinically acceptable safety and reactogenicity profile in the different vaccination groups, aligned with the very well-known profiles of the study vaccines.

References: None.

GLOSSARY OF TERMS

Adverse event:	Any untoward medical occurrence in a patient or clinical investigation subject, temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product. An adverse event (AE) can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a medicinal product. For marketed medicinal products, this also includes failure to produce expected benefits (i.e. lack of efficacy), abuse or misuse.
Blinding:	A procedure in which one or more parties to the trial are kept unaware of the treatment assignment in order to reduce the risk of biased study outcomes. The level of blinding is maintained throughout the conduct of the trial, and only when the data are cleaned to an acceptable level of quality will appropriate personnel be unblinded or when required in case of a serious adverse event. In an open-label study, no blind is used. Both the investigator and the subject know the identity of the treatment assigned.
Child in care:	A child who has been placed under the control or protection of an agency, organization, institution or entity by the courts, the government or a government body, acting in accordance with powers conferred on them by law or regulation. The definition of a child in care can include a child cared for by foster parents or living in a care home or institution, provided that the arrangement falls within the definition above. The definition of a child in care does not include a child who is adopted or has an appointed legal guardian.
Eligible:	Qualified for enrolment into the study based upon strict adherence to inclusion/exclusion criteria.
Epoch:	An epoch is a self-contained set of consecutive timepoints or a single timepoint from a single protocol. Self-contained means that data collected for all subjects at all timepoints within that epoch allows to draw a complete conclusion to define or precise the targeted label of the product. Typical examples of epochs are primary vaccinations, boosters, yearly immunogenicity follow-ups, and surveillance periods for efficacy or safety.
eTrack:	GSK's tracking tool for clinical trials.

Evaluable:	Meeting all eligibility criteria, complying with the procedures defined in the protocol, and, therefore, included in the according-to-protocol (ATP) analysis (see Sections 5.6.2 and 5.10.4 for details on criteria for evaluability).
Immunological correlate of protection:	The defined humoral antibody response above which there is a high likelihood of protection in the absence of any host factors that might increase susceptibility to the infectious agent.
Intercurrent medical condition:	A condition that has the capability of altering a subject's immune response or are confirmed to have an immunodeficiency condition during the study.
Investigational vaccine/product: **(Synonym of Investigational Medicinal Product)**	A pharmaceutical form of an active ingredient or placebo being tested or used as a reference in a clinical trial, including a product with a marketing authorization when used in a way different from the approved form, or when used for an unapproved indication, or when used to gain further information about an approved use.
Primary completion date:	The date that the final subject was examined or received an intervention for the purpose of final collection of data for the primary outcome, whether the clinical trial concluded according to the pre-specified protocol or was terminated.
Randomization:	Process of random attribution of treatment to subjects in order to reduce bias of selection.
Self-contained study:	Study with objectives not linked to the data of another study.
Site Monitor:	An individual assigned by the sponsor who is responsible for assuring proper conduct of clinical studies at one or more investigational sites.
Solicited adverse event:	AEs to be recorded as endpoints in the clinical study. The presence/occurrence/intensity of these events is actively solicited from the subject or an observer during a specified post-vaccination follow-up period.
Subject:	Term used throughout the protocol to denote an individual who has been contacted in order to participate or participates in the clinical study, either as a recipient of the vaccines or as a control.
Subject number:	A unique number identifying a subject, assigned to each subject consenting to participate in the study.

Treatment:	Term used throughout the clinical study to denote a set of investigational product(s) or marketed product(s) or placebo intended to be administered to a subject, identified by a unique number, according to the study randomization or treatment allocation.
Treatment number:	A number identifying a treatment to a subject, according to the study randomization or treatment allocation.
Unsolicited adverse event:	Any AE reported in addition to those solicited during the clinical study. Also any 'solicited' symptom with onset outside the specified period of follow-up for solicited symptoms will be reported as an unsolicited adverse event.

TRADEMARKS

The following trademarks are used in the present report.

Note: In the body of the Study Report, the names of the vaccines/products and/or medications will be written without the superscript symbol ™ or ® and in *italics*.

Trademarks of the GlaxoSmithKline group of companies	Generic description
Engerix-B	Hepatitis B vaccine (recombinant)
Hiberix	*Haemophilus influenzae* type b conjugate vaccine (tetanus toxoid conjugate)
Infanrix	Diphtheria and Tetanus Toxoids and Acellular Pertussis Vaccine Adsorbed
Infanrix hexa	Combined diphtheria-tetanus-acellular pertussis, hepatitis B, inactivated polio vaccine and *Haemophilus influenzae* type b vaccine
Pediarix	Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed, Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine
Rotarix	Rotavirus Vaccine, Live, Oral

Trademarks not owned by the GlaxoSmithKline group of companies	Generic description
ActHIB **(Sanofi Pasteur SA)**	*Haemophilus influenzae* type b conjugate vaccine (tetanus toxoid conjugate)
Pentacel **(Sanofi Pasteur SA)**	Diphtheria and tetanus toxoids and acellular pertussis adsorbed, inactivated poliovirus and *Haemophilus influenzae* type b conjugate (tetanus toxoid conjugate)
Prevnar **(Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.)**	Pneumococcal 7-valent conjugate vaccine (diphtheria CRM_{197} protein)
Prevnar13 **(Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.)**	Pneumococcal 13-valent conjugate vaccine (diphtheria CRM_{197} protein)

1. ETHICS

1.1. Institutional Review Board (IRB)

The study protocol, two protocol amendments, the informed consent, and other information that required pre-approval were reviewed and approved by a national, regional, or investigational centre IRB.

1.2. Ethical conduct of the study

This study was conducted in accordance with ethical principles that have their origins in the Declaration of Helsinki, the principles of "good clinical practice" (GCP) and all applicable regulatory requirements.

1.3. Subject information and consent

Written informed consent was obtained from each subject's parent(s) / legally acceptable representative (LAR) prior to the performance of any study-specific procedures.

2. INVESTIGATORS AND STUDY ADMINISTRATIVE STRUCTURE

This study was conducted by multiple investigators across 43 centers in the United States (US). GSK Biologicals, King of Prussia, PA, US was responsible for administration of the study including clinical trial supply management and laboratory facilities.

Dr. Nicola Klein at the Kaiser Permanente Oakland, One Kaiser Plaza, Oakland, CA, USA was the principal investigator.

The following contract research organisations (CROs) were involved in this study:

Name of vendor	Address	Role
Q^2 Solutions	Global Headquarters 5827 South Miami Blvd Morrisville, NC 27560, USA	Sample management and Logistics
InVentiv Clinical Solutions	Corporate Headquarters 3201 Beechleaf Court Suite 600 Raleigh, NC 27604-1547, USA	Clinical Trial Administration, Study Management (SM), Contract support

3. INTRODUCTION

Combination vaccines have been developed to provide multiple immunizations in a single injection. They can simplify vaccine administration and have the potential to promote compliance and cost-effectiveness by decreasing the number of injections needed to immunize a child [Zinke, 2010; Kalies, 2006]. Use of combination vaccines can alleviate concerns associated with the number of injections to be given at one time [ACIP, 2011].

GlaxoSmithKline (GSK) Biologicals' *Infanrix hexa* vaccine helps prevent six diseases in a single injection. *Infanrix hexa* is licensed for primary and booster vaccination in more than 98 countries around the globe, including the entire European Union. The vaccine complies with the World Health Organization (WHO) requirements for manufacture of biological substances for all of its antigenic components. The *Infanrix hexa* vaccine consists of a combination of GSK's *Pediarix* (Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed, Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine Combined); STN 103907, approved in the US on December 13, 2002 and a *Haemophilus influenzae* (*H. influenzae*) type B (Hib) vaccine consisting of purified polyribosyl-ribitol-phosphate (PRP) capsular polysaccharide of *Haemophilus influenzae* type b covalently bound to tetanus toxoid (TT). The conjugated Hib-TT is the same as that used for the formulation of *Hiberix* [*Haemophilus* b Conjugate Vaccine (Tetanus Toxoid Conjugate)] (licensed in the US as a booster dose in August 2009, and as a primary dose in January 2016), with the only difference that in *Infanrix hexa*, the Hib-conjugate is adsorbed onto aluminium phosphate.

The *Infanrix hexa* combination vaccine would provide an additional source of DTaP (combined diphtheria-tetanus-acellular pertussis vaccine), hepatitis B, poliovirus, and Hib containing vaccines for the US market and would potentially reduce the number of injections required to provide infants with recommended vaccinations.

GSK has an extensive clinical safety database for *Infanrix hexa*. The safety and immunogenicity data of the vaccine have been evaluated in numerous controlled studies [Dhillon, 2010; Zepp, 2009], of which 4 were conducted in the US with approximately 3000 US subjects exposed to a primary vaccination with *Infanrix hexa*.

3.1. Rationale for the study

Infanrix hexa was licensed in the European Union in 2000. More than 150 million doses have been distributed to date and the benefit/risk profile remains favorable. Licensure of *Infanrix hexa* combination vaccine in the US was to provide an additional option for vaccination within the routine US pediatric schedule with the fewest number of injections, which would create opportunities to add further injections in case other novel vaccines against important pediatric diseases become available. Furthermore, *Infanrix hexa* was to provide an additional source of DTaP, hepatitis B, poliovirus, and Hib-containing vaccine to the US market, which would help ensure a more stable supply.

The present study 117119 (DTPA-HBV-IPV-135) was intended to generate pivotal immunogenicity data demonstrating non-inferiority of the immune responses against pertussis antigens of *Infanrix hexa* compared to *Pediarix*, which is currently one of the DTaP combination vaccines widely used as a standard of care in the US. Additionally, this study was to also provide descriptive data with regard to the immunogenicity of the other vaccine antigens and the safety profile in US subjects. These pivotal immunogenicity non-inferiority data for pertussis and descriptive safety data were intended to support the registration of GSK Biologicals' combined DTPa-HBV-IPV/Hib (*Infanrix hexa*) vaccine in the US. A subsequent Phase III study was planned to provide pivotal data regarding lot-to-lot consistency, safety and the immunogenicity of the other vaccine antigens.

Comparison of immunogenicity data from separate clinical studies for *Infanrix hexa* and *Pentacel*, given on a 2-4-6 month schedule, suggests that the immune response to the Hib component of these vaccines is similar. This study was to provide descriptive information regarding the immune response to the Hib components of *Infanrix hexa* and *Pentacel* following a 3-dose primary series, prior to further evaluation in Phase III studies.

4. STUDY OBJECTIVES

4.1. Primary objective

4.1.1. Epoch 001 (Primary vaccination)

- To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens [pertussis toxoid (PT), filamentous haemagglutinin (FHA) and pertactin (PRN)] one month after the third dose of the primary vaccination.

  Criteria for non-inferiority:

  Non-inferiority in terms of immune response to pertussis antigens was to be demonstrated if, for each of the three antigens, the upper limit of the 95% confidence interval (CI) on the GMC ratio [Pedia divided by Hexa] was ≤ 1.5.

Refer to Section 5.10.1 for the definition of the primary endpoint.

4.2. Secondary objectives

4.2.1. Epoch 001 (Primary vaccination)

- To assess the immune response to *Infanrix hexa*, *Pediarix*, *ActHIB*, *Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to D (Diphtheria), T (Tetanus), HBs (Hepatitis B surface antigen), pertussis, poliovirus types 1, 2 and 3 and PRP (Polyribosyl-Ribitol-Phosphate) antigens, one month after the third dose of the primary vaccination.
- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa*, of *Pentacel* co-administered with *Engerix-B*, and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events, new-onset chronic illnesses (NOCIs; referred to as new-onset chronic diseases (NOCDs) in the protocol) and serious adverse events (SAEs).

4.2.2. Epoch 002 (Booster vaccination)

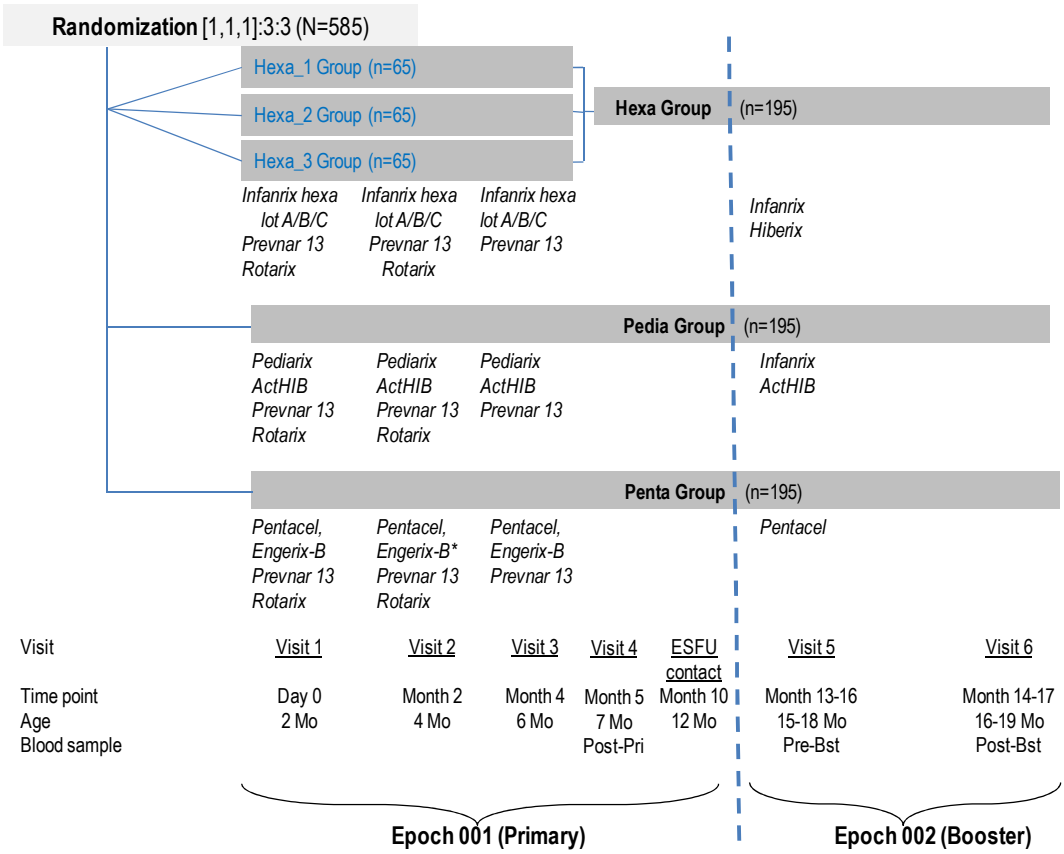
- To assess the immunogenicity of *Infanrix hexa*, *Pentacel*, *Engerix-B*, *Pediarix* and *ActHIB*, in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.
- To assess the immune response to *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*, in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix* and *Pentacel*, one month after the booster dose.
- To assess the safety and reactogenicity of booster doses of *Infanrix, Hiberix, ActHIB* and *Pentacel*.

Refer to Section 5.10.2 for the definition of the secondary endpoints.

5. INVESTIGATIONAL PLAN

5.1. Study design

5.1.1. Overview



N = number of subjects in the study; n = number of subjects in each group; Mo = months
Visit 3 should be conducted at least 8 weeks after Visit 2, with subjects at least 24 weeks of age, in order to comply with US recommendations on hepatitis B dosing
Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002
* *Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group
ESFU = Extended safety follow-up

5.1.2. Overall study design – Description

- Experimental design: Phase III, open-label, randomized, controlled, multi-centric, single-country study with five parallel groups.
- Duration of the study: The intended duration of the study per subject was approximately 14-17 months.
  - **Epoch 001**: Primary, starting at Visit 1 (Day 0) and ending at safety follow up contact (i.e. six months following the third dose, Month 10);
  - **Epoch 002**: Booster, starting at Visit 5 (Month 13-16) and ending at Visit 6 (Month 14-17).
- Study groups: The study groups and epochs foreseen in the study are presented in Table 1.

Table 1 Study groups and epochs foreseen in the study

Study groups	Number of subjects	Age (Min/Max) at Visit 1	Epochs	
			Epoch 001	Epoch 002
Hexa_1	65	6 weeks -12 weeks	x	x
Hexa_2	65	6 weeks -12 weeks	x	x
Hexa_3	65	6 weeks -12 weeks	x	x
Pedia	195	6 weeks -12 weeks	x	x
Penta	195	6 weeks -12 weeks	x	x

The study groups and treatment foreseen in the study are presented in Table 2.

Table 2 Study groups and treatment foreseen in the study

Treatment name	Vaccine/Product name	Study Groups				
		Hexa_1	Hexa_2	Hexa_3	Pedia	Penta
Epoch 001						
Infanrix hexa		x	x	x		
	Hib					
Pediarix					x	
ActHIB	ActHIB				x	
	NaCl					
Pentacel	DTaP-IPV (Sanofi Pasteur)					x
	ActHIB					
Engerix-B*	HBV					x
Prevnar13	Prevenar 13	x	x	x	x	x
Rotarix	HRV	x	x	x	x	x
	$CaCO_3$					
Epoch 002						
Infanrix	DTPa	x	x	x	x	
Hiberix	Hib	x	x	x		
	NaCl					
ActHIB	ActHIB				x	
	NaCl					
Pentacel	DTaP-IPV (Sanofi Pasteur)					x
	ActHIB					

* *Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group.

- Control: active controls.
  - Epoch 001: *Pediarix* + *ActHIB* and *Pentacel* + *Engerix-B*;
  - Epoch 002: *Infanrix* + *ActHIB* and *Pentacel*.

  Vaccination schedules:

  Epoch 001

  - **Hexa Group**: Subjects in this group were to receive three doses of *Infanrix hexa* (lot A, lot B or lot C as per the group allocation) co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
    - Hexa_1 Group: Subjects were to receive lot A of *Infanrix hexa*;
    - Hexa_2 Group: Subjects were to receive lot B of *Infanrix hexa;*
    - Hexa_3 Group: Subjects were to receive lot C of *Infanrix hexa*.
  - **Pedia Group:** Subjects in this group were to receive three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
  - **Penta Group:** Subjects in this group were to receive three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

  *Subjects in the Penta Group who received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination were not to receive *Engerix-B* at 4 months of age (Visit 2).

  Epoch 002

  - **Hexa Group:** Subjects were to receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.
  - **Pedia Group:** Subjects were to receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.
  - **Penta Group:** Subjects were to receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

  The fourth dose of pneumococcal conjugate vaccine is recommended to be administered at approximately 12-15 months of age. Since the booster dose of the candidate vaccine/active controls were given in this study at 15-18 months of age, the fourth dose of *Prevnar13* was not to be administered as part of the study protocol. Subject's parent(s)/LARs were to be reminded at Visit 3 and Visit 4 to consult their primary health care provider regarding the fourth dose of *Prevnar13* at 12-15 months for their child.

- As the analyses were to be performed regardless of the lot of *Infanrix hexa* received, unless otherwise specified, the Hexa_1, Hexa_2 and Hexa_3 groups were pooled together for the analysis and were called the Hexa group.
- Treatment allocation: The subjects were randomized at a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. This was done at study entry using GSK Biologicals' central randomization system on internet (SBIR).

- Blinding: The study was open-label for both epochs (Table 3) due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing was blinded to the treatment, and codes were used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

The blinding of study epochs is presented in Table 3.

Table 3 Blinding of study epochs

Study Epochs	Blinding
Epoch 001	open
Epoch 002	open

- Sampling schedule: Blood samples were drawn from all subjects at the following time points:
  - Post-Pri (Visit 4): One month after the third dose of primary vaccination, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) was collected.
  - Pre-Bst (Visit 5): Before the administration of the booster dose, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) was collected.
  - Post-Bst (Visit 6): One month after the booster vaccination, a volume of at least 3.5 mL of whole blood (to provide at least 1.2 mL of serum) was collected.
- Type of study: self-contained.
- Data collection: electronic Case Report Form (eCRF).

5.1.3. Discussion of study design

5.1.3.1. Design of Epoch 001 (primary vaccination):

The study was designed as a randomized, controlled, open-label study with five parallel groups:

- The first three groups (Hexa_1, Hexa_2 and Hexa_3 group) were to receive three doses of the *Infanrix hexa* vaccine (either lot A, lot B or lot C, respectively). These three groups were pooled together for the analyses and the pooled group was called the Hexa group.
- The Pedia Group (Control 1) was to receive three doses of the US-licensed control vaccines, *Pediarix* and *ActHIB*.
- The Penta Group (Control 2) was to receive three doses of the US-licensed control vaccines, *Pentacel* and *Engerix-B* (only two doses of *Engerix-B* were to be administered if a subject had received a birth dose of hepatitis B vaccine).

Three distinct vaccine lots manufactured according to the same procedures were used in the Hexa group in order to obtain more representative data for the vaccine.

The study was open-label due to the differences in the number of injections and the appearance of the vaccines administered.

Vaccines (i.e., *Prevnar13* and *Rotarix*) that were recommended for children in the US during the first year of life were administered concomitantly with the other study vaccines as part of the study.

5.1.3.2. Design of Epoch 002 (booster vaccination):

In Epoch 002, the subjects were assessed for antibody persistence to the vaccine antigens of *Infanrix hexa*. This epoch was also to assess the adequacy of priming subjects with *Infanrix hexa* by evaluating the boostability of D, T, Pa (Acellular *Bordetella pertussis* component) and Hib antigens with the US-licensed vaccines. The pooled Hexa Group was to receive booster doses of *Infanrix* and *Hiberix* vaccines at 15 through 18 months of age, the subjects in the Penta Group were to receive *Pentacel* vaccine as a booster, and the subjects in the Pedia Group were to receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15 through 18 months of age.

The study was to continue to be open-label in Epoch 002.

5.2. Study procedures

Note: The double-line border indicated the analyses which were performed on all data obtained up to that visit or contact.

● was used to indicate a study procedure that required documentation in the individual eCRF

○ was used to indicate a study procedure that did not require documentation in the individual eCRF

Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001

Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002

Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002

† Visit 3 was to be conducted at least 8 weeks after Visit 2 and when the subject was at least 24 weeks of age

$^{\alpha}$ The child could still continue in the study even if the mother did not wish to provide consent to record her Tdap vaccination history.

$^{\beta}$ Only the Tdap vaccination history (during the pregnancy of the enrolled child) from mothers who had given consent to provide this information, was obtained and recorded in the eCRF.

[δ] For the Penta group, which received only one vaccine at Visit 5, baseline measurement of only the limb receiving the vaccine was required
** If subject in the Penta Group received a birth dose of Hep B vaccine, no administration of *Engerix-B* was foreseen at Visit 2 (4-months of age)
* Refer to Section 5.9.2.1 and the study protocol (Section on Baseline measurement of limb circumference after booster vaccination at Visit 5) for detailed explanation on the reporting of large injection site reactions
§ Refer to Section 5.6 for details
‖ Refer to Section 5.7 for details
‡ New onset of chronic illness (NOCI) included events such as autoimmune disorders, asthma, type I diabetes and allergies
# Refer to Section 5.10.8 for details

It was the investigator's responsibility to ensure that intervals between visits were strictly followed. The intervals between study visits are presented in Table 5.

Table 5 Intervals between study visits

Interval	Optimal length of interval[1]
Birth→Visit 1	6-12 weeks (42-90 days) of age[2]
Visit 1 →Visit 2	49-83 days[2]
Visit 2 →Visit 3 *	56-90 days[2]
Visit 3 → Visit 4	30-48 days[2] †
Visit 3 → Phone call (ESFU contact)	180-210 days**
Birth→ Visit 5^	15-18 months of age[2]
Visit 5 → Visit 6	30-48 days[2] †

[1] Whenever possible the investigator was to arrange within this interval;
[2] Subjects were not to be eligible for inclusion in one or more cohorts for analysis if they made the study visit outside this interval. For Visit 3-Visit 4 and Visit 5-Visit 6, an interval of 21-48 days was considered for the According-to-protocol (ATP) cohort of immunogenicity. Refer to Section 5.10.4 for the definition of the cohorts for analysis;
* Advisory Committee on Immunization Practices (ACIP) recommendation stated that minimum age of last Hep B dose was 24 weeks and this last dose was to be administered at least 8 weeks after the previous dose. So, Visit 3 was to be conducted at least 8 weeks after Visit 2 and when the subject was at least 24 weeks of age
† It was preferred that subjects came in for Visit 4 and Visit 6, at least 30 days after Visits 3 and 5, respectively. If subjects returned for the visit prior to 30 days, they were to take home the diary card and continue to record unsolicited safety information until 30 days post-vaccination and mail/send it upon completion. Investigators were to make an attempt to retrieve diary cards from subjects who had not mailed/sent them in.
^ Visit 5 was to occur after the ESFU. ESFU was to occur prior to vaccination if Visit 5 coincided with the 6 months post-Visit 3 time-point.
** Adherence to the interval pertaining to phone contact was only indicative and was not to determine a subject's eligibility for inclusion for ATP analysis. However, the interval was to be respected in order to obtain safety information over the complete 6 months extended safety follow up period.

5.3. Selection of study population

5.3.1. Number of subjects/centers

Target enrolment was 585 subjects (65 each in Hexa_1, Hexa_2, Hexa_3 groups and 195 each in Pedia and Penta groups). Enrolment was to be terminated when the target number of subjects had been enrolled. Refer to Section 5.10.3 for a detailed description of the criteria used in the estimation of sample size.

This study was conducted at multiple centers (43 centers) in the US.

Actual numbers of subjects enrolled versus target was monitored by the site monitor using SBIR.

5.3.2. Inclusion criteria for enrolment

Deviations from inclusion criteria were not allowed because they could potentially jeopardize the scientific integrity of the study, regulatory acceptability or subject safety. Therefore, adherence to the criteria as specified in the protocol was essential.

All subjects were to satisfy ALL the following criteria at study entry:

- Subjects' parent(s)/ LAR(s) who, in the opinion of the investigator, could and would comply, with the requirements of the protocol (e.g. completion of the diary cards, return for follow-up visits).
- A male or female between, and including, 6 and 12 weeks of age at the time of the first vaccination.
- Born full-term (i.e. after a gestation period of 37 weeks to less than 42 completed weeks [259 to 293 days]).
- Written informed consent obtained from parent(s)/LAR(s) of the subject.
- Healthy subjects as established by medical history and clinical examination before entering into the study.
- Infants who had not received a previous dose of hepatitis B vaccine or those who had received only 1 dose of hepatitis B vaccine administered at least 30 days prior to enrolment.

5.3.3. Exclusion criteria

Deviations from exclusion criteria were not allowed because they could potentially jeopardize the scientific integrity of the study, regulatory acceptability or subject safety. Therefore, adherence to the criteria as specified in the protocol was essential.

The following criteria were to be checked at the time of study entry. If ANY exclusion criterion applied, the subject must not be included in the study:

- Child in care

  Please refer to the GLOSSARY OF TERMS for the definition of child in care.
- Use of any investigational or non-registered product (drug or vaccine) other than the study vaccines within 30 days preceding the first dose of study vaccines, or planned use during the study period.
- Chronic administration (defined as more than 14 days in total) of immunosuppressants or other immune-modifying drugs since birth. For corticosteroids, this meant prednisone ≥ 0.5 mg/kg/day, or equivalent. Inhaled and topical steroids were allowed.

- Planned administration/administration of a vaccine not foreseen by the study protocol within the period starting from 30 days before the first vaccination until 30 days after Dose 3 (Epoch 001, primary vaccination) and from 30 days before the booster Dose 4 until 30 days after booster Dose 4 (Epoch 002, booster vaccination), i.e. the end of the study:
  - Inactivated influenza and hepatitis A vaccines were allowed throughout the study.
  - Routine administration(s) of vaccines were allowed from 30 days after the last dose of primary vaccination until 30 days before the booster dose and after post-booster blood sampling. Routine administration of measles-mumps-rubella vaccine, varicella, pneumococcal vaccines were allowed from 30 days after last dose of primary vaccine until 30 days before booster dose and from post-booster blood sampling, as well as according to the recommended immunization schedule in US.
- Concurrently participating in another clinical study, at any time during the study period, in which the subject had been or was to be exposed to an investigational or a non-investigational product (pharmaceutical product or device).
- History of Hib, diphtheria, tetanus, pertussis, pneumococcal, rotavirus, poliovirus and hepatitis B diseases.
- Previous vaccination against Hib, diphtheria, tetanus, pertussis, pneumococcus, rotavirus and/or poliovirus; more than one previous dose of hepatitis B vaccine.
- Any confirmed or suspected immunosuppressive or immunodeficient condition, based on medical history and physical examination (no laboratory testing required).
- Family history of congenital or hereditary immunodeficiency.
- History of any reaction or hypersensitivity likely to be exacerbated by any component of the vaccines (including yeast).
- Hypersensitivity to latex.
- Major congenital defects or serious chronic illness.
- History of any neurological disorders including seizures.
- Administration of immunoglobulins and/or any blood products since birth or planned administration during the study period.
- History of intussusception or of any uncorrected congenital malformation of the gastrointestinal tract that would predispose the infant to intussusception.
- History of Severe Combined Immunodeficiency Disease (SCID).
- Acute disease and/or fever at the time of enrolment.
  - Fever was defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study was rectal for Epoch 001 and axillary for Epoch 002.
  - Subjects with a minor illness (such as mild diarrhea, mild upper respiratory infection) without **fever** could be enrolled at the discretion of the investigator.

5.3.4. Withdrawal criteria

5.3.4.1. Subject completion

Any subject who returned for the concluding visit / was available for the concluding contact foreseen in the protocol, was considered to have completed the study.

5.3.4.2. Subject withdrawal

Withdrawals were not to be replaced.

5.3.4.2.1. Subject withdrawal from the study

From an analysis perspective, a 'withdrawal' from the study referred to any subject who did not come back for the concluding visit/was not available for the concluding contact foreseen in the protocol.

All data collected until the date of withdrawal/last contact of the subject was used for the analysis.

A subject was considered a 'withdrawal' from the study when no study procedure had occurred, no follow-up had been performed and no further information had been collected for this subject from the date of withdrawal/last contact.

Investigators were to make an attempt to contact those subjects who did not return for scheduled visits or follow-up.

Information relative to the withdrawal was documented in the eCRF. The investigator was to document whether the decision to withdraw a subject from the study was made by the subject's parent(s) or LAR(s), or by the investigator, as well as which of the following possible reasons was responsible for withdrawal:

- Serious adverse event
- Non-serious adverse event
- Protocol violation (specify)
- Consent withdrawal, not due to an adverse event*
- Moved from the study area
- Lost to follow-up
- Other (specify)

*In case a subject was withdrawn from the study because the subject's parent(s) had withdrawn consent, the investigator was to document the reason for withdrawal of consent, if specified by the parents/ LARs, in the eCRF.

Subjects who were withdrawn from the study because of SAEs/AEs were to be clearly distinguished from subjects who were withdrawn for other reasons. Investigators were to follow subjects who were withdrawn from the study as result of a SAE/AE until resolution of the event (see Section 5.9.8.2).

5.3.4.2.2. Subject withdrawal from investigational vaccine

A 'withdrawal' from the investigational vaccine referred to any subject who did not receive the complete treatment, i.e. when no further planned dose was administered from the date of withdrawal. A subject withdrawn from the investigational vaccine could not necessarily be withdrawn from the study as further study procedures or follow-up could be performed (safety or immunogenicity) if planned in the study protocol.

Information relative to premature discontinuation of the investigational vaccine was to be documented on the Vaccine Administration screen of the eCRF. The investigator was to document whether the decision to discontinue further vaccination/treatment was made by the subject's parent(s) or LAR(s), or by the investigator, as well as which of the following possible reasons was responsible for withdrawal:

- Serious adverse event.
- Non-serious adverse event.
- Other (specify).

5.4. Composition and administration of vaccine(s)

5.4.1. Description of vaccines

All candidate vaccines that were used were developed and manufactured by GSK Biologicals, except for the following four marketed vaccines with name of manufacturer provided in brackets: *ActHIB* (Sanofi Pasteur SA), *Pentacel* (Sanofi Pasteur SA), *Prevnar* (Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.), and *Prevnar13* (Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.).

The Quality Control Standards and Requirements for each candidate vaccine were described in separate Quality Assurance documents (e.g. release protocols, certificate of analysis) and the required approvals were obtained.

The vaccines were labelled and packed according to applicable regulatory requirements.

Commercial vaccines were assumed to comply with the specifications given in the manufacturer's Summary of Product Characteristics (SPC).

Table 6 Study vaccines

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Infanrix hexa Lot A: AC21VB448C and AHIBC950C; Lot B: AC21B514A and AHIBC907D; Lot C: AC21B510B and AHIBC954A.	DTPa-HBV-IPV	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; Aluminium=700µg Al3+	The DTPa-HBV-IPV component was presented as a turbid white suspension in a pre-filled syringe.	full volume^	3
	Hib	PRP=10µg; TT~=25µg Aluminum as salts = 0.12 mg	The lyophilized Hib component was presented as a white pellet in a glass vial; it was reconstituted before use with the DTPa-HBV-IPV component.		
Pediarix Lot no.: AC21VB448C	DTPa-HBV-IPV	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; Aluminium=700µg Al3+	The DTPa-HBV-IPV component was presented as a turbid white suspension in a pre-filled syringe.	0.5 mL	3
ActHIB Lot no.: DLOCA106AZ (Alternative Lot no. UH971AA), DLOCA150AZ (Alternative Lot no. UI117AA; only for Epoch 2). Lot no.: DLOCA106AY (Alternative Lot no. UH954AB), DLOCA150AY (Alternative Lot no. UI128AA; only for Epoch 2).	ActHIB	Hib=10µg TT, TT=24µg	White lyophilized pellet in a single dose vial, it was reconstituted before use with sterile 0.4% saline solution	0.5 mL*	4
	NaCl	NaCl=60mM	Sterile 0.4% saline solution		

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Pentacel First Lot: Lot no. DLOCA102AY (Alternative Lot no. C4507AA) Lot no.: DLOCA102AZ (Alternative Lot no. C4557AA) Second Lot: Lot no. DLOCA108AY (Alternative Lot no. C4517BA) Lot no.: DLOCA108AZ (Alternative Lot no. C4574AA) Third Lot Lot no. DLOCA144AY (Alternative Lot. No. C4724AA) DLOCA144AZ (Alternative Lot. No.C4642AA)	DTaP-IPV (Sanofi Pasteur)	PT=20µg; FHA=20µg; FIM=5µg; PRN=3µg; DT=15Lf; TT=5Lf; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU	Suspension for injection (0.5-mL dose) supplied as a liquid vaccine component in a single dose vial. The lyophilized Hib component was presented as a white pellet in a separate glass vial. It was reconstituted with the liquid DTaP-IPV component before use.	0.5 mL*	4
	Hib	PRP=10µg TT,TT=24µg; $AlPO_4$=330µg Al3+			
Engerix-B Lot no.: AHBVC253A	HBV	HBsAg=10µg; $Al(OH)_3$=250µg Al3+	Suspension pre-filled syringe	0.5 mL	2 or 3**
Infanrix Lot no.: AC14B195A	DTPa	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; $AlPO_4$=500µg Al3+	Homogeneous, turbid, white suspension in a pre-filled syringe	0.5 mL	1
Hiberix Lot no.: AHIBC875A Lot no.: DEXTA517AZ	Hib	PRP=10µg; TT~=25µg	The lyophilized Hib component was presented as a white pellet in a glass vial; it was reconstituted before use with sterile 0.9% saline solution.	0.5 mL*	1
	NaCl	NaCl=150mM	Sterile 0.9% saline solution		

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Prevnar13 Lot no.: DLOCA107A (Alternative Lot no. H39264)	Prevenar 13	PS1=2.2µg CRM197; PS3=2.2µg CRM197; PS4=2.2µg CRM197; PS5=2.2µg CRM197; PS6A=2.2µg CRM197; PS6B=4.4µg CRM197; PS7F=2.2µg CRM197; PS9V=2.2µg CRM197; PS14=2.2µg CRM197; PS18C=2.2µg CRM197; PS19A=2.2µg CRM197; PS19F=2.2µg CRM197; PS23F=2.2µg CRM197; $AlPO_4$=125µg Al3+	Suspension for injection in a pre-filled syringe.	0.5 mL	3
Rotarix Lot no.: AROTVA291D Lot no. AD05VA833A	HRV	HRV RIX4414=$10^{6.0}$ $CCID_{50}$	Lyophilized vaccine in a monodose glass vial was reconstituted with the calcium carbonate buffer diluent	1.0 mL*	2
	$CaCO_3$	$CaCO_3$=60µg	Diluent (calcium carbonate liquid buffer) supplied separately in prefilled syringe		

$CCID_{50}$ = median Cell Culture Infective Dose; DMEM = Dulbecco's Modified Eagle Medium
* After reconstitution
** Subjects in the Penta Group who received a birth dose of hepatitis B vaccine were not to receive *Engerix-B* at the Month 4 visit (Visit 2)
^ Full volume after reconstitution (0.5 mL) to be administered

5.4.2. Dosage and administration of study vaccines

The injectable vaccines must be administered intramuscularly, at a 90-degree angle into the anterolateral side of the thigh [Centers for Disease Control and Prevention (CDC), 2002] on the side stated in Table 7. The buttock was not to be used.

In order to ensure proper intramuscular injection of the vaccines, a needle of at least 1 inch (2.54 cm) length, 25 gauge was used [Diggle, 2006; Zuckerman, 2000].

For reconstitution of *Infanrix hexa* vaccine, an appropriate needle was attached to the prefilled syringe containing the DTPa-HBV-IPV liquid vaccine and inserted into the vial containing the lyophilized Hib vaccine. The entire contents of the syringe were to be transferred to the vial. With needle still inserted, the vial was to be vigorously shaken. After reconstitution, the full volume of the vial (0.5 mL) was then withdrawn using the same syringe. A new needle was then to be affixed to the syringe for administration of the vaccine.

NOTE: After reconstitution, *Infanrix hexa* was to be injected immediately. However the vaccine might have been kept for up to 8 hours at room temperature (21°C).

The vaccinees were observed closely for at least 30 minutes following the administration of vaccines, with appropriate medical treatment readily available in case of a rare anaphylactic reaction.

Rotarix must be exclusively administered orally. DO NOT INJECT.

The contraindications and warnings/precautions to vaccination were specified in the protocol (see protocol for details).

Table 7 Dosage and administration

Visit	Study Group	Treatment name	Route [1]	Site [2]	Side [3]
Epoch 001					
1, 2, 3	Hexa Group	*Infanrix hexa* (lot A, lot B or lot C)	IM	T	R
1, 2, 3		*Prevnar13*	IM	T	LoL
1, 2		*Rotarix*	O	-	-
1, 2, 3	Pedia Group	*Pediarix*	IM	T	R
1, 2, 3		*ActHIB*	IM	T	UpL
1, 2, 3		*Prevnar13*	IM	T	LoL
1, 2		*Rotarix*	O	-	-
1, 2, 3	Penta Group	*Pentacel*	IM	T	R
1, 2, 3		*Engerix-B*†	IM	T	UpL
1, 2, 3		*Prevnar13*	IM	T	LoL
1, 2		*Rotarix*	O	-	-
Epoch 002*					
5	Hexa Group	*Infanrix*	IM	T	R
		Hiberix	IM	T	L
5	Pedia Group	*Infanrix*	IM	T	R
		ActHIB	IM	T	L
5	Penta Group	*Pentacel*	IM	T	R

[1]Oral (O), Intramuscular (IM); [2]Thigh (T), [3]Left (L), Right (R), Upper Left (UpL), Lower Left (LoL)
Note: Vaccination could be performed in the opposite side in case of medical indication preventing vaccination in the side stated in the table, as judged by the investigator
†Subjects in the Penta Group who received a birth dose of hepatitis B vaccine were not to receive *Engerix-B* at the Month 4 visit (Visit 2).
* Toddlers (12 Months through 2 Years): For toddlers, the vastus lateralis muscle in the anterolateral thigh was preferred. The needle was at least 1-inch long. The deltoid muscle could be used if the muscle mass was adequate.

5.4.3. Treatment allocation and randomisation

5.4.3.1. Subject identification

After checking the inclusion/exclusion criteria, subject numbers were assigned sequentially to subjects whose parent(s)/LAR(s) gave consent for their child to participate in the study, according to the range of subject numbers allocated to each study center. Subject numbers were also to be used to identify blood samples collected during the study.

5.4.3.2. Randomization of treatment

5.4.3.2.1. Randomization of supplies

The numbering of supplies was performed at GSK Biologicals, using MATerial EXcellence (MATEX), a program developed for use in Statistical Analysis System (SAS®) (Cary, NC, USA) by GSK Biologicals.

To allow GSK Biologicals to take advantage of greater rates of recruitment than anticipated at individual centers in this multi-center study and to thus reduce the overall study recruitment period, an over-randomization of supplies was prepared.

Epoch 001

A first list based on a randomization blocking scheme using a [1:1:1]:3:3 randomization ratio was used to number the following vaccines for Doses 1, 2 and 3.

- DTPa-HBV-IPV/Hib lot A
- DTPa-HBV-IPV/Hib lot B
- DTPa-HBV-IPV/Hib lot C
- *Pediarix*
- *Pentacel*

The vaccines from this list were distributed to the study center while respecting the randomization block size.

ActHIB, *Engerix-B*, *Prevnar13* and *Rotarix* were numbered independently using a sequential numbering.

Epoch 002

Four sequential lists (one for *Infanrix*, one for *Hiberix*, one for *ActHIB* and one for *Pentacel*) were used to number the vaccine doses for the Epoch 002.

The study staff members in charge of the vaccine administration were to access SBIR, provide the subject identification number and the dose number. The system was to provide a new treatment number for all the vaccines to be administered to a subject (*Pentacel*, *Infanrix* + *ActHIB* or *Infanrix* + *Hiberix*). This was consistent with the allocated study group.

5.4.3.2.2. Treatment allocation to the subject

The treatment numbers were allocated by dose.

Study group and treatment number allocation

The target was to enroll 585 subjects to be randomly assigned to five study groups in a [1:1:1]:3:3 ratio (195 subjects in the pooled lots group).

Allocation of each subject to a study group at the investigator site was performed using SBIR. The randomization algorithm was to use a minimization procedure accounting for the study as a whole and for each of the centers with equal weight.

After obtaining the signed and dated Informed Consent Form (ICF) from the subject's parent(s)/LAR(s) and having checked the eligibility of the subject, the site staff member in charge of the vaccine administration was to access SBIR. Upon providing the subject identification number, the randomization system was to ask whether the subject had a previous hepatitis B vaccination and was to use the minimization algorithm to determine the group allocation and the appropriate treatment number for *Pentacel*, *Pediarix* or for *Infanrix hexa* (lot A, lot B or lot C) to be used for the subject.

SBIR was to also provide treatment numbers for co-administered vaccines *Engerix B*, *ActHib*, *Prevnar13* vaccine and a *Rotarix* vaccine, each one labelled with a different treatment number. Therefore a subject was to have three or four different treatment numbers allocated at dose 1.

The number of each administered treatment had to be recorded in the eCRF on the Vaccine Administration screen.

When SBIR was not available, study staff members were referred to the SBIR user guide or the SPM for specific instructions.

Treatment number allocation for subsequent doses

For each dose subsequent to the first dose, the study staff member in charge of the vaccine administration was to access SBIR, provide the subject identification number, the dose number and the system was to provide new treatment numbers consistent with the allocated study group.

Each vaccine was to be labelled with a different treatment number.

The number of each administered treatment must be recorded in the eCRF on the Vaccine Administration screen.

Note that in the Penta Group, the investigator was to be reminded that *Engerix-B* was not allowed at dose 2, for subjects with previous hepatitis B vaccination. So for these subjects, the treatment identified by SBIR for dose 2 was not to be used.

5.5. Blinding

The study was open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing was to be blinded to the treatment, and codes were used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

5.6. Prior and concomitant medication /vaccinations

At each study visit/contact, the investigator was to question the subject's parent(s)/LAR(s) about any medication/product taken and vaccination received by the subject.

5.6.1. Recording of concomitant medications/products and concomitant vaccination

The following concomitant medications/products/vaccines must be recorded in the eCRF if administered during the indicated recording period:

- All concomitant medications/products, except vitamins and dietary supplements, administered within 30 days following each dose of study vaccine.
- Any concomitant vaccination administered since birth and ending 30 days after the booster dose (Visit 6). Vaccinations listed prior to the first dose of study vaccine were to be recorded as vaccination history. The fourth dose of *Prevnar13* was to be recorded as concomitant vaccination.
- Prophylactic medication (i.e. medication administered in the absence of ANY symptom and in anticipation of a reaction to the vaccination).

  E.g. an anti-pyretic was considered to be prophylactic when it was given in the absence of fever and any other symptom, to prevent fever from occurring [fever was defined as temperature ≥ 38.0°C/100.4°F by any route].
- Any concomitant medications/products/vaccines listed in Section 5.6.2.
- Any concomitant medication/product/vaccine relevant to a SAE* or administered at any time during the study period for the treatment of a SAE*.

  * Refer to those SAEs that are required to be reported per protocol.

5.6.2. Concomitant medications/products/vaccines that may lead to the elimination of a subject from ATP analyses

The use of the following concomitant medications/products/vaccines was not to require withdrawal of the subject from the study but may determine a subject's evaluability in the ATP analysis. See Section 5.10.4 for study cohorts/ data sets to be analysed.

- Any investigational or non-registered product (drug or vaccine) other than the study vaccines used during the study period (starting from Visit 1 and ending at Visit 6).
- Immunosuppressants or other immune-modifying drugs administered chronically (i.e. more than 14 days) during the study period until the final blood sample (Visit 6). For corticosteroids, this meant prednisone ≥ 0.5 mg/kg/day, or equivalent. Inhaled and topical steroids were allowed.
- A vaccine not foreseen by the study protocol administered during the period starting from 30 days before the first vaccination until Post-Pri blood sampling i.e. approximately 30 days after Dose 3 (Epoch 001) and from 30 days before Pre-Bst until Post-Bst blood sampling i.e. approximately 30 days after Dose 4 (Epoch 002). Thus, routine administration(s) of measles-mumps-rubella, varicella and pneumococcal vaccines were allowed from 30 days after the last dose of primary vaccination (after Post-Pri blood sampling) until 30 days before the booster dose and from 30 days after the booster dose (after Post-Bst blood sampling), as well as according to the recommended immunization schedule in the US.
- Exceptions:
  - Inactivated influenza vaccine and hepatitis A vaccines were allowed throughout the study.

    In case an emergency mass vaccination for an unforeseen public health threat (e.g.: a pandemic) was organized by the public health authorities, outside the routine immunization program, the time period described above could be reduced if necessary for that vaccine provided it is licensed and used according to its SPC or Product Information and according to the local governmental recommendations and provided a written approval of the Sponsor was obtained.
- Immunoglobulins and/or any blood products administered during the study period until the final blood sample (Visit 6).

5.7. Intercurrent medical conditions that may lead to elimination of a subject from ATP analyses

At each study visit subsequent to the first vaccination visit, it had to be verified if the subject had experienced or was experiencing any intercurrent medical condition. If it was the case, the condition(s) had to be recorded in the eCRF.

- Subjects could be eliminated from the ATP cohort for immunogenicity if they incurred a condition that had the capability of altering their immune response or were confirmed to have an immunodeficiency condition.
- Subjects were to be eliminated from the ATP cohort for immunogenicity if they experienced intercurrent diphtheria, tetanus, pertussis, poliomyelitis, hepatitis B and/or Hib prior to the post-dose 3 blood draw and diphtheria, tetanus, pertussis and/or Hib post-dose 4 blood draw.

5.8. Assessment of immunogenicity variables

5.8.1. Biological samples

Table 8 Biological samples

Sample type	Quantity*	Unit	Timepoint
Blood	5	mL	Month 5 (Post-Pri)
Blood	5	mL	Month 13-16 (Pre-Bst)
Blood	3.5	mL	Month 14-17 (Post-Bst)

* Approximate quantity
Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002

5.8.2. Laboratory assays

At Visits 4, 5 and 6, blood was to be collected for measurement of immune response. Total blood volume to be taken from each subject over the study period was approximately 13.5 mL (approximately 5.0 mL of whole blood to provide approximately 1.7 mL of serum at Visits 4 and 5 and at least 3.5 mL of whole blood to provide approximately 1.2 mL of serum at Visit 6). All serology was to be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized procedures with adequate controls. All serology for primary endpoints were to be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized, validated procedures with adequate controls.

The laboratory assays for humoral immunity are presented in Table 9.

Table 9 Humoral Immunity (Antibody determination)

System	Component	Method	Test kit/ Manufacturer	Unit	Cut-off	Laboratory
Serum	*Bordetella pertussis*. Pertussis Toxin Ab.IgG	ELISA	In-house*	IU/mL	2.693	GSK Biologicals§
Serum	*Bordetella pertussis*. Filamentous Hemaglutinin Ab.IgG	ELISA	In-house*	IU/mL	2.046	GSK Biologicals§
Serum	*Bordetella pertussis*. Pertactin Ab.IgG	ELISA	In-house*	IU/mL	2.187	GSK Biologicals§
Serum	*Corynebacterium diphtheriae*. Diphtheria Toxoid Ab.IgG	ELISA	In-house*	IU/mL	0.057	GSK Biologicals§
Serum	*Clostridium tetani*. Tetanus Toxoid Ab.IgG	ELISA	In-house*	IU/mL	0.043	GSK Biologicals§
Serum	Hepatitis B Virus.Surface Ab	CLIA	Centaur (Siemens Healthcare)	mIU/mL	6.2	GSK Biologicals§
Serum	Poliovirus Sabin Types 1, 2 and 3	NEUTRA	In-house*	ED_{50}	8	GSK Biologicals§
Serum	*Haemophilus influenzae* type b. Polyribosyl Ribitol Phosphate Ab ‡	ELISA	In-house*	µg/mL	0.15 (qualified assay) 0.066 (fully validated assay)	GSK Biologicals§

*In-house refers to assays developed internally by GSK which could be performed at GSK Biologicals' laboratories or external laboratory designated by GSK.
§GSK Biologicals laboratory referred to the Global Vaccines Clinical Laboratories (GVCL) (current name: Clinical Laboratory Sciences) in Rixensart and Wavre, Belgium.
‡For anti-PRP post-dose 3, the primary vaccination results were presented using the qualified assay and the fully validated assay. The booster vaccination results were presented only using the fully validated assay.
ELISA = Enzyme-Linked Immunosorbent Assay
NEUTRA = Neutralization Assay
CLIA = ChemiLuminescence ImmunoAssay

The GSK Biologicals' clinical laboratories have established a Quality System supported by procedures. The activities of GSK Biologicals' clinical laboratories are audited regularly for quality assessment by an internal (sponsor-dependent) but laboratory-independent Quality Department.

5.8.3. Biological samples evaluation

5.8.3.1. Immunological read-outs

The immunological read-outs are presented in Table 10.

Table 10 Immunological read-outs

Blood sampling time point		No. of subjects	Components and priority rank
Type of contact and time point	Sampling time point		
Visit 4 (Month 5)	Post-Pri	585 (All)	PRN, FHA, PT, PRP, D, T, HBs, Poliovirus type 1, Poliovirus type 2, Poliovirus type 3
Visit 5 (Month 13-16)	Pre-Bst	585 (All)	PRN, FHA, PT, PRP, D, T, HBs, Poliovirus type 1, Poliovirus type 2, Poliovirus type 3
Visit 6 (Month 14-17)	Post-Bst	585 (All)	PRN, FHA, PT, PRP, D, T

Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002

In case of insufficient blood sample volume to perform assays for all antibodies, the samples were analysed according to priority ranking provided in Table 10.

5.8.4. Immunological correlates of protection

The following cut-offs were accepted as immunological correlates of protection:

- Specific antibodies against diphtheria toxoid (anti-diphtheria) and tetanus toxoid (anti-tetanus) were to be measured by enzyme-linked immunosorbent assay (ELISA). An antibody concentration ≥0.1 International Units per ml (IU/ml) was considered a conservative estimate of the percentage of subjects deemed to be protected [Camargo, 1984; Melville-Smith, 1983].
- Antibodies to the hepatitis B surface antigen (anti-HBs) were measured using ChemiLuminescence ImmunoAssay (CLIA). An antibody concentration ≥10 mIU/ml defined seroprotection [Centers for Disease Control and Prevention (CDC), 1991; WHO, 1988].
- Antibodies against poliovirus types 1, 2 and 3 were determined by a virus micro-neutralization test adapted from the WHO Guidelines for WHO/EPI Collaborative Studies on Poliomyelitis [WHO, 1993]. The lowest dilution at which serum samples were tested was 1:8, from which a test was considered positive. Titers were expressed in terms of the reciprocal of the dilution resulting in 50% inhibition. Antibody titers greater than or equal to this value were considered as protective.
- Data from subjects given unconjugated Hib vaccine suggested that, in the absence of induction of immunological memory, a concentration of 0.15 µg/mL was indicative of short-term protection, with 1 µg/mL considered indicative of long-term protection [Käyhty, 1983; Anderson, 1984].

- No serological correlate of protection against pertussis has been established [Granström, 1987; Karpinsky, 1987]. Antibodies against the pertussis components PT, FHA and PRN were measured by ELISA. The assay cut-off values were: 2.693 IU/mL for anti-PT (pertussis toxoid), 2.046 IU/mL for anti-FHA (filamentous haemagglutinin), and 2.187 IU/mL for anti-PRN (pertactin). Subjects with antibody concentration below the cut-off were considered seronegative.

For the purpose of identification of sub-optimal responders and communication to the investigators, anti-HBs and anti-poliovirus types 1, 2 and 3 assessment of the protection level were done for each subject on samples taken approximately 4 weeks after the 3rd dose of the primary vaccination. For PRP, D and T antigens, the assessment of the protection level was done for each subject on samples taken approximately 4 weeks after the administration of the booster dose. In addition a listing of subjects who did not seroconvert to anti-PT, anti-FHA and anti-PRN was provided.

The immunological assay results were communicated to the investigator (Visit 4 for HBV and poliovirus; Visit 6 for PRP, D, T and pertussis antigens).

The investigator was encouraged to share the immunological assay results for non-responders with the study subjects' parent(s)/LAR(s).

For the study subjects identified as non-responders, it remained the responsibility of the study investigator in charge of the subject's clinical management to determine the medical need for re-vaccination and to re-vaccinate the subjects as per local/regional practices.

5.9. Assessment of safety variables

The investigator or site staff was/were responsible for the detection, documentation and reporting of events meeting the criteria and definition of an adverse event (AE) or serious adverse event (SAE) as provided in the protocol.

Each subject's parent(s)/LAR(s) were instructed to contact the investigator immediately should the subject manifest any signs or symptoms they perceived as serious.

5.9.1. Safety definitions

5.9.1.1. Definition of an adverse event

An AE was any untoward medical occurrence in a clinical investigation subject, temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product.

An AE could therefore be any unfavourable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a medicinal product. For marketed medicinal products, this also included failure to produce expected benefits (i.e. lack of efficacy), abuse or misuse.

Examples of an AE included:

- Significant or unexpected worsening or exacerbation of the condition/indication under study.
- New conditions detected or diagnosed after investigational vaccines administration even though they may have been present prior to the start of the study.
- Signs, symptoms, or the clinical sequelae of a suspected interaction.
- Signs, symptoms, or the clinical sequelae of a suspected overdose of either investigational vaccines or a concurrent medication (overdose per se was not to be reported as an AE/SAE).
- Signs, symptoms temporally associated with vaccine administration.
- Significant failure of expected pharmacological or biological action.
- Pre- or post-treatment events that occurred as a result of protocol-mandated procedures (i.e. invasive procedures, modification of subject's previous therapeutic regimen).

AEs to be recorded as endpoints (solicited AEs) are described in Section 5.9.2. All other AEs were recorded as UNSOLICITED AEs.

Examples of an AE DO NOT include:

- Medical or surgical procedures (e.g. endoscopy, appendectomy); the condition that led to the procedure was an AE/SAE.
- Situations where an untoward medical occurrence did not occur (e.g. social and/or convenience admission to a hospital, admission for routine examination).
- Anticipated day-to-day fluctuations of pre-existing disease(s) or condition(s) present or detected at the start of the study that did not worsen.
- Pre-existing conditions or signs and/or symptoms present in a subject prior to the first study vaccination. These events were recorded in the medical history section of the eCRF**.**

5.9.1.2. Definition of a serious adverse event

A serious adverse event was any untoward medical occurrence that:

a. Resulted in death,

b. Was life-threatening,

   Note: The term 'life-threatening' in the definition of 'serious' refers to an event in which the subject was at risk of death at the time of the event. It did not refer to an event, which hypothetically might have caused death, had it been more severe.

c. Required hospitalisation or prolongation of existing hospitalisation,

   Note: In general, hospitalisation signified that the subject had been admitted at the hospital or emergency ward for observation and/or treatment that would not have been appropriate in the physician's office or in an out-patient setting. Complications

that occurred during hospitalisation were also considered AEs. If a complication prolonged hospitalisation or fulfilled any other serious criteria, the event was also to be considered serious. When in doubt as to whether 'hospitalisation' occurred or was necessary, the AE was to be considered serious.

Hospitalisation for elective treatment of a pre-existing condition (known or diagnosed prior to informed consent signature) that did not worsen from baseline was NOT considered an AE.

d. Resulted in disability/incapacity,

Note: The term disability meant a substantial disruption of a person's ability to conduct normal life functions. This definition was not intended to include experiences of relatively minor medical significance such as uncomplicated headache, nausea, vomiting, diarrhea, influenza like illness, and accidental trauma (e.g. sprained ankle) which could interfere or prevent everyday life functions but did not constitute a substantial disruption.

Medical or scientific judgement was to be exercised in deciding whether reporting was appropriate in other situations, such as important medical events that were not immediately life-threatening or resulted in death or hospitalisation but could jeopardise the subject or could require medical or surgical intervention to prevent one of the other outcomes listed in the above definition. These were also to be considered serious. Examples of such events were invasive or malignant cancers, intensive treatment in an emergency room or at home for allergic bronchospasm, blood dyscrasias or convulsions that did not result in hospitalisation.

5.9.2. Solicited adverse events

A 4-day follow-up (Day 0-Day 3) of solicited local (at each injection site) and general AEs was performed after administration of the vaccine. Data concerning the following AEs were solicited using diary cards provided by the sponsor.

5.9.2.1. Solicited local (injection-site) adverse events

The following local (injection-site) AEs were solicited (Table 11):

Table 11 Solicited local adverse events

Pain at injection site
Redness at injection site
Swelling at injection site
Post-dose 4 measurements of circumference of limbs (arm or leg according to where vaccine was administered)

N.B. If parent(s) /LAR(s) of infants observed any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of limb circumference) after the booster dose at Visit 5, they were to contact study personnel and to visit the investigator's office for evaluation as soon as possible and bring

the diary card with them. The investigator was to record detailed information describing the AE on a specific large injection site reaction form in the eCRF. In addition to the diameter of the swelling and the circumference of the limb that were reported as solicited symptoms the parent(s)/LAR(s) were to record additional symptoms/characteristics as mentioned in the protocol (Section on Recording of AEs, SAEs and NOCIs).

Note: local AEs were not solicited for co-administered vaccines like *Prevnar 13*.

5.9.2.2. Solicited general adverse events

The following general AEs were solicited (Table 12):

Table 12 Solicited general adverse events

Drowsiness
Fever
Irritability/Fussiness
Loss of appetite

Note: Temperature was recorded in the evening. Should additional temperature measurements be performed at other times of day, the highest temperature was recorded. Fever was defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study was rectal for Epoch 001 and axillary for Epoch 002.

5.9.3. Clinical laboratory parameters and other abnormal assessments qualifying as adverse events or serious adverse events

In absence of diagnosis, abnormal laboratory findings (e.g. clinical chemistry, haematology, urinalysis) or other abnormal assessments (e.g. vital signs etc.) that were judged by the investigator to be clinically significant were recorded as AE or SAE if they met the definition of an AE or SAE (refer to Sections 5.9.1.1 and 5.9.1.2). Clinically significant abnormal laboratory findings or other abnormal assessments that were present at baseline and significantly worsened following the start of the study were also reported as AEs or SAEs. However, clinically significant abnormal laboratory findings or other abnormal assessments that were associated with the disease being studied, unless judged by the investigator as more severe than expected for the subject's condition, or that were present or detected at the start of the study and did not worsen, were not reported as AEs or SAEs.

The investigator was to exercise his or her medical and scientific judgement in deciding whether an abnormal laboratory finding or other abnormal assessment was clinically significant.

5.9.4. Adverse events of specific interest

Adverse events of specific interest (i.e. NOCIs such as autoimmune disorders, asthma, type I diabetes and allergies) were recorded from Day 0 up to 6 months after the last primary vaccination (Epoch 001) and from booster dose up to one month after booster vaccination (Epoch 002). NOCIs were reported as either AEs or SAEs, as appropriate in the eCRF.

5.9.5. Detecting and recording adverse events and serious adverse events

5.9.5.1. Time period for detecting and recording adverse events and serious adverse events

All AEs starting within 30 days following administration of each dose of study vaccine/comparator were recorded into the appropriate section of the eCRF, irrespective of intensity or whether or not they were considered vaccination-related.

The time period for collecting and recording SAEs and AEs of specific interest was to begin at the first receipt of study vaccine/comparator and to end 180 days following administration of the last dose of study vaccine/comparator of the primary vaccination course for each subject and 30 days following administration of the booster dose. Instructions on reporting of SAEs were specified in the protocol (see protocol for details).

All AEs/SAEs leading to withdrawal from the study were collected and recorded from the time of the first receipt of study vaccine/comparator.

In addition to the above-mentioned reporting requirements and in order to fulfil international reporting obligations, SAEs that were related to study participation (i.e. protocol-mandated procedures, invasive tests, a change from existing therapy) or were related to a concurrent GSK medication/vaccine were collected and recorded from the time the subject consented to participate in the study until she/he was discharged from the study.

Note: With the exception of AEs/SAEs leading to withdrawal, study participation and concurrent GSK medications or vaccines, there was no reporting of SAEs from the time of the Epoch 1 extended safety follow-up (ESFU) phone contact and administration of dose 4 (approximately three months).

An overview of the protocol-required reporting periods for AEs and SAEs is given in Table 13.

Table 13 Reporting periods for adverse events and serious adverse events

Study activity	C.O	V1	4-days post vac	31-days post-vac	V2	4-days post vac	31-days post-vac	V3	4-days post- vac	31-days post-vac	Phone call 6 months post-V3	V5	4-days post- vac	31-days post-vac
Age of subject		2 months			4 months			6 months		7 months	12 months	15-18 months		16-19 months
Solicited local and general AEs														
Large injection site reactions														
Unsolicited AEs														
AEs/SAEs leading to withdrawal from the study														
NOCIs														
SAEs														
SAEs related to study participation or concurrent GSK medication/vaccine														

NOCI: New Onset of Chronic Illnesses; C.O: consent obtained; V: Visit; Post-V: Post-Visit; vac: vaccination

5.9.6. Post-Study adverse events and serious adverse events

A post-study AE/SAE was defined as any event that occurred outside of the AE/SAE reporting period defined in Table 13. Investigators were not obligated to actively seek AEs or SAEs in former study participants. However, if the investigator learned of any SAE at any time after a subject had been discharged from the study, and he/she considered the event reasonably related to the investigational vaccine/product, the investigator was to promptly notify the Study Contact for Reporting SAEs.

5.9.7. Evaluation of adverse events and serious adverse events

5.9.7.1. Active questioning to detect adverse events and serious adverse events

As a consistent method of collecting AEs, the subject's parent(s)/LAR(s) were to be asked a non-leading question such as:

'*Has your child acted differently or felt different in any way since receiving the vaccine or since the last visit?*'

When an AE/SAE occurred, it was the responsibility of the investigator to review all documentation (e.g. hospital progress notes, laboratory and diagnostics reports) relative to the event. The investigator would then record all relevant information regarding an AE/SAE in the eCRF. The investigator was not allowed to send photocopies of the subject's medical records to GSK Biologicals instead of appropriately completing the eCRF. However, there could be instances when copies of medical records for certain cases were requested by GSK Biologicals. In this instance, all subject identifiers were blinded on the copies of the medical records prior to submission to GSK Biologicals.

The investigator was to attempt to establish a diagnosis pertaining to the event based on signs, symptoms, and/or other clinical information. In such cases, the diagnosis was to be documented as the AE/SAE and not the individual signs/symptoms.

5.9.7.2. Assessment of adverse events

5.9.7.2.1. Assessment of intensity

The intensity of the following solicited AEs were assessed as described:

Table 14 Intensity scales for solicited symptoms in infants/toddlers

Infant/Toddler (15–24 months)		
Adverse Event	**Intensity grade**	**Parameter**
Pain at injection site	0	None
	1	Mild: Minor reaction to touch
	2	Moderate: Cries/protests on touch
	3	Severe: Cries when limb is moved/spontaneously painful
Redness at injection site		Record greatest surface diameter in mm
Swelling at injection site		Record greatest surface diameter in mm
Increase in limb circumference post-dose 4 (arm or leg according to where vaccine was administered)		Record the limb circumference at the level of the injection site
Fever*		Record temperature in °C/°F
Irritability/Fussiness	0	Behaviour as usual
	1	Mild: Crying more than usual/no effect on normal activity
	2	Moderate: Crying more than usual/interferes with normal activity
	3	Severe: Crying that cannot be comforted/prevents normal activity
Drowsiness	0	Behaviour as usual
	1	Mild: Drowsiness easily tolerated
	2	Moderate: Drowsiness that interferes with normal activity
	3	Severe: Drowsiness that prevents normal activity
Loss of appetite	0	Appetite as usual
	1	Mild: Eating less than usual/no effect on normal activity
	2	Moderate: Eating less than usual/interferes with normal activity
	3	Severe: Not eating at all

* Fever was defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study was rectal for Epoch 001 and axillary for Epoch 002.

The maximum intensity of local injection site redness/swelling/fever was scored at GSK Biologicals as follows:

0 : Absent
1 : ≤ 5 mm
2 : > 5 mm and ≤ 20 mm
3 : > 20 mm

The maximum intensity of fever was scored at GSK Biologicals as follows:

0	=	<100.4°F	<38.0°C
1	=	≥100.4°F to ≤102.2°F	≥38.0°C to ≤39.0°C
2	=	>102.2°F to ≤104.0°F	>39.0°C to ≤40.0°C
3	=	> 104.0°F	> 40.0°C

Following each vaccination (3 doses during the primary vaccination course and one booster dose) during the 4 days after the vaccine dose had been administered (day of vaccination and subsequent 3 days), the child's temperature was screened each evening, at bedtime, for signs of fever by means of the rectal/axillary thermometer. Children < 15 months were to have their temperature taken rectally and children ≥ 15 months were to have their temperature taken by the axillary route. Rectal/axillary temperatures were recorded on the diary card. Temperatures measured by any route were presented in 0.5°C increments starting at 38°C/100.4°F.

Prior to analysis, the increase in limb circumference of each limb as compared to the baseline pre-vaccination measurement was scored at GSK Biologicals for each subject with large injection site reaction as follows:

Grade 0 = Increase in limb circumference ≤5 mm

1 = Increase in limb circumference >5 mm but ≤20 mm

2 = Increase in limb circumference >20 mm but ≤40 mm

3 = Increase in limb circumference >40 mm

The investigator was to assess the maximum intensity that occurred over the duration of the event for all unsolicited AEs (including SAEs) recorded during the study. The assessment was based on the investigator's clinical judgement.

For unsolicited symptoms and adverse events associated with large injection site reactions (e.g. pruritus, induration and functional impairment), the intensity was to be assigned to one of the following categories:

1 (mild)	=	An AE which was easily tolerated by the subject, causing minimal discomfort and not interfering with everyday activities.
2 (moderate)	=	An AE which was sufficiently discomforting to interfere with normal everyday activities.
3 (severe)	=	An AE which prevented normal, everyday activities. In a young child, such an AE would, for example, prevent attendance at school/kindergarten/a day-care center and would cause the parent(s)/LAR(s) to seek medical advice.

An AE that was assessed as Grade 3 (severe) was not to be confused with a SAE. Grade 3 was a category used for rating the intensity of an event; and both AEs and SAEs could be assessed as Grade 3. An event was defined as 'serious' when it met one of the pre-defined outcomes as described in Section 5.9.1.2.

5.9.7.2.2. Assessment of causality

The investigator was obligated to assess the relationship between investigational vaccines and the occurrence of each AE/SAE. The investigator used clinical judgement to determine the relationship. Alternative plausible causes, such as natural history of the underlying diseases, concomitant therapy, other risk factors, and the temporal relationship of the event to the investigational vaccines were considered and investigated. The investigator was also to consult the IB (Investigators Brochure) and/or Product Information for marketed products to determine his/her assessment. Investigational vaccines included vaccines such as *Infanrix hexa*, *Pediarix*, *Pentacel*, *ActHIB*, *Engerix-B*, *Rotarix*, *Prevnar 13*, *Infanrix* and *Hiberix*.

There could be situations when a SAE had occurred and the investigator had minimal information to include in the initial report to GSK Biologicals. However, it was very important that the investigator always made an assessment of causality for every event prior to submission of the SAE report to GSK Biologicals. The investigator could change his/her opinion of causality in light of follow-up information and update the SAE information accordingly. The causality assessment was one of the criteria used when determining regulatory reporting requirements.

Due to concomitant administration of multiple vaccines, it might not be possible to determine the causal relationship of general AEs to the individual vaccines administered. The investigator was to, therefore, assess whether the AE could be causally related to vaccination rather than to the individual vaccines.

All solicited local (injection site) reactions were considered causally related to vaccination. As the individual vaccines were administered to separate sites, the investigator was to make an assessment of local reactogenicity at the vaccine level e.g. *Infanrix* or *Hiberix*. Causality of all other AEs were assessed by the investigator using the following question:

Is there a reasonable possibility that the AE could have been caused by the investigational vaccines?

YES	:	There was a reasonable possibility that the vaccines contributed to the AE.
NO	:	There was no reasonable possibility that the AE was causally related to the administration of the study vaccine(s). There were other, more likely causes and administration of the study vaccine(s) was not suspected to have contributed to the AE.

If an event met the criteria to be determined as ‘serious’ (see Section 5.9.1.2), additional examinations/tests were performed by the investigator in order to determine ALL possible contributing factors for each SAE.

Possible contributing factors included:

- Medical history
- Other medication
- Protocol required procedure
- Other procedure not required by the protocol
- Lack of efficacy of the vaccines, if applicable
- Erroneous administration
- Other cause (specify)

5.9.7.3. Assessment of outcomes

The investigator was to assess the outcome of all unsolicited AEs (including SAEs) recorded during the study as:

- Recovered/resolved
- Recovering/resolving
- Not recovered/not resolved
- Recovered with sequelae/resolved with sequelae
- Fatal (SAEs only)

5.9.7.4. Medically attended visits

For each solicited and unsolicited symptom the subject experienced, the subject's parent(s)/LAR(s) were asked if the subject received medical attention defined as hospitalisation, or an otherwise unscheduled visit to or from medical personnel for any reason, including emergency room visits. This information was recorded in the eCRF.

5.9.8. Follow-up of adverse events and serious adverse events

5.9.8.1. Follow-up during the study

After the initial AE/SAE report, the investigator was required to proactively follow each subject and provide additional relevant information on the subject's condition to GSK Biologicals (within 24 hours for SAEs; refer to the protocol for further details).

All SAEs documented at a previous visit/contact and designated as not recovered/not resolved or recovering/resolving were reviewed at subsequent visits/contacts until the end of the study.

All AEs documented at a previous visit/contact and designated as not recovered/not resolved or recovering/resolving were reviewed at subsequent visits/contacts until 30 days after the last vaccination.

New onset of chronic diseases (such as autoimmune disorders, asthma, type I diabetes and allergies) documented at a previous visit/contact and designated as not recovered/not resolved or recovering/resolving were reviewed at subsequent visits/contacts until end of the study.

5.9.8.2. Follow-up after the subject was discharged from the study

The investigator was to follow subjects:

- with SAEs, or subjects withdrawn from the study as a result of an AE, until the event had resolved, subsided, stabilized, disappeared, or until the event was otherwise explained, or the subject was lost to follow-up.
- with other non-serious AEs of specific interest, i.e. NOCIs, such as autoimmune disorders, asthma, type I diabetes and allergies, until the end of the study period or they were lost to follow-up.

If the investigator received additional relevant information on a previously reported SAE, he/she was to provide this information to GSK Biologicals using a paper SAE form.

GSK Biologicals could request that the investigator perform or arrange the conduct of additional clinical examinations/tests and/or evaluations to elucidate as fully as possible the nature and/or causality of the AE or SAE. The investigator was obliged to assist. If a subject died during participation in the study or during a recognized follow-up period, GSK Biologicals would provide any available post-mortem findings, including histopathology.

5.10. Statistical methods

The statistical analyses were performed using the SAS version 9. Refer to Section 5.12.2 for a description of differences with planned statistical methods.

5.10.1. Primary endpoint

5.10.1.1. Epoch 001 (Primary vaccination)

- Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.

5.10.2. Secondary endpoints

5.10.2.1. Epoch 001 (Primary vaccination)

- Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa, Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*.
  - Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3 and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after each vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after each vaccination, according to the Medical Dictionary for Regulatory Activities (MedDRA) classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from Day 0 up to six months post primary vaccination.

5.10.2.2. Epoch 002 (Booster vaccination)

- Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).

- Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1.0 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1.0 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Infanrix*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1.0 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix*.
  - Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1.0 µg/mL one month after the booster dose (Dose 4)
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after booster vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after booster vaccination, according to the MedDRA classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from the booster dose up to one month after the booster vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from the booster dose up to one month after the booster vaccination.

5.10.3. Determination of sample size

Target enrolment was 585 subjects. Assuming 65% of the subjects were evaluable post-dose 3, this would provide approximately 378 subjects (126 subjects in each group) evaluable for immunogenicity in the Epoch 001.

The sample size was estimated in order to obtain at least 94% power to demonstrate the primary inferential objective (i.e. non-inferiority of the response to the pertussis antigens). The power associated to the target sample size for the conclusion on the inferential primary objective of this study is detailed in the next section.

5.10.3.1. Control on type I error

A 2.5% nominal type I error was used for each pertussis non-inferiority (NI) evaluation. Since NI was to be met simultaneously for the 3 pertussis antigens, the global type I error would be below 2.5%.

5.10.3.2. References for sample size

References were chosen based on observed standard deviations (SDs) observed in studies Hib-MenCY-TT-005 (101858) and Hib-MenCY-TT-009 (103813) one month post-dose 3 from the subjects that received *ActHIB* co-administered with *Pediarix* and *Prevnar*, and from study DTPa-HBV-IPV-027 (217744/027) one month post-dose 3 from the DTPa-HBV-IPV/Hib pooled groups. All these studies enrolled subjects in the US.

The standard deviation for $\log_{10}$ transformed concentrations post vaccination for pertussis antigens is presented in Table 15.

Table 15 Standard deviation for $\log_{10}$ transformed concentration post vaccination

Study	Antigen					
	PT		FHA		PRN	
	N	SD	N	SD	N	SD
Hib-MenCY-TT-005-US	215	0.274	213	0.312	217	0.392
Hib-MenCY-TT-009 – US cohort	100	0.258	97	0.252	101	0.482
DTPa-HBV-IPV-027-US	865	0.274	802	0.254	869	0.376
Reference taken		0.274		0.307		0.392

N: Number of subjects; SD: standard deviation

5.10.3.3. Power computation

Out of the 585 subjects enrolled, 65% (126 in each pooled group) were expected to be evaluable post-Dose 3.

The individual type II error for each pertussis antigen was obtained using PASS 2005, one-sided non-inferiority test for 2 means from normal data with common variance between groups, under the alternative of equal means and alpha=2.5% (Table 16).

To account for the multiplicity of comparisons, the global type II error was conservatively estimated as the sum of individual type II errors, ensuring a global power for the study of 94.02% as presented in Table 16.

Table 16 Power for pertussis NI post-Dose 3

Antigen	Margin	SD on log_{10} transformed titer	Type I error	N evaluable per pooled group	Type II error
PT	1.5	0.274	2.5%	126	0.08%
FHA	1.5	0.307	2.5%	126	0.48%
PRN	1.5	0.392	2.5%	126	5.42%
Global Power = 100-(0.08+0.48+5.42) % = 94.02%					

5.10.4. Study cohorts /data sets analyzed

Six cohorts were defined for the purpose of the analysis:

- Primary Total Vaccinated cohort (TVC)
- Primary ATP cohort for analysis of safety
- Primary ATP cohort for analysis of immunogenicity
- Booster Total Vaccinated cohort
- Booster ATP cohort for analysis of safety
- Booster ATP cohort for analysis of immunogenicity

5.10.4.1. Primary Total vaccinated cohort

The Primary Total Vaccinated cohort (TVC) included all vaccinated subjects for whom data were available.

- A safety analysis based on the Primary TVC included all subjects with at least one vaccine administration documented.
- An immunogenicity analysis based on the Primary TVC included all vaccinated subjects for whom data concerning at least one immunogenicity endpoint measure was available.

5.10.4.2. Primary ATP cohort for analysis of safety

The Primary ATP cohort for safety consisted of all subjects from the Primary TVC who complied with the protocol up to the end of Epoch 001, namely all subjects:

- who met all inclusion criteria and no exclusion criteria for the study;
- who had received all planned study vaccines for each completed vaccination visit in Epoch 001;
- for whom administration site of study vaccines was known and was according to protocol;
- who did not receive a product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in the study protocol.

Note that for the purpose of ATP cohort definition, the Epoch 001 ended at Visit 4.

Adherence to the interval related to ESFU phone contact was not to be taken into account for inclusion in the ATP cohort for safety.

5.10.4.3. Primary ATP cohort for analysis of immunogenicity

The Primary ATP cohort for immunogenicity consisted of all subjects from the Primary ATP cohort for safety who complied with eligibility criteria and study procedures (see the protocol for the definition of the intervals) up to the post-dose 3 blood sample and had immunogenicity results for the post-dose 3 blood sample. The analysis was performed per treatment (first dose) actually administered.

More specifically, the analysis post-dose 3 based on the ATP cohort for immunogenicity included all eligible subjects:

- who received all the study vaccines up to dose 3 as per the vaccination schedule;
- for whom administration site and route of study vaccines up to dose 3 was as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 4 (Month 5) which led to elimination from an ATP analysis as listed in the protocol;
- who did not present with a medical condition before the blood sampling at Visit 4 (Month 5) which led to elimination from an ATP analysis as listed in the protocol.
- who complied with the post-dose 3 blood sample schedule, i.e. 21-48 days post-dose 3.
- who were not administered a vaccine not foreseen by the study protocol before the corresponding post-vaccination blood sample.
- who had immunogenicity results post-dose 3.

In addition for Hep-B analysis, hemolysed samples were excluded from the Primary ATP cohort for immunogenicity.

5.10.4.4. Booster Total vaccinated cohort

The Booster TVC included all subjects from the primary TVC that received the booster vaccine dose.

- For the Booster-TVC analysis of safety, this included all subjects with booster vaccine administration documented.
- For the Booster-TVC analysis of immunogenicity, this included vaccinated subjects for whom data concerning immunogenicity endpoint measures were available.

5.10.4.5. Booster ATP cohort for analysis of safety

The Booster ATP cohort for safety consisted of all subjects from the Booster TVC who complied with the protocol up to the end of Epoch 002, namely all subjects:

- who met all inclusion criteria and no exclusion criteria for the study;
- who had received the planned booster dose at 15-18 months of age;
- who received 3 doses in Epoch 001;
- for whom administration site of study vaccines was known and was according to protocol;
- who did not receive a product before the blood sampling at Visit 6 (Months 14-17) which led to elimination from an ATP analysis as listed in the protocol.

5.10.4.6. Booster ATP cohort for analysis of immunogenicity

The Booster ATP cohort for immunogenicity consisted of all subjects from the Booster ATP cohort for safety who complied with eligibility criteria and study procedures (see the protocol for the definition of the intervals) up to the post-dose 4 blood sample and had immunogenicity results for the post-dose 4 blood sample.

More specifically, the analysis pre- and post-dose 4 based on the Booster ATP cohort for immunogenicity included all eligible subjects:

- who received all the study vaccines up to dose 4 as per the vaccination schedule;
- for whom administration site and route of the study vaccines up to dose 4 was as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 6 (Months 14-17) which led to elimination from an ATP analysis (see the protocol);
- who did not present with a medical condition before the blood sampling at Visit 6 (Months 14-17) which led to elimination from an ATP analysis (see the protocol);
- who complied with the booster vaccination schedule at 15-18 months of age and with the post-dose 4 blood sample schedule i.e. 21-48 days for post-dose 4;
- who had immunogenicity results post-dose 4.

5.10.5. Derived and transformed data

5.10.5.1. Demography

For a given subject and a given demographic variable, missing measurements were not to be replaced except for age.

Age was to be calculated as the number of years between the date of birth and the date of vaccination.

5.10.5.2. Immunogenicity

- A seronegative subject was a subject whose antibody concentration/titer was below the assay cut-off (see Section 5.8.2 for cut-off details).
- A seropositive subject was a subject whose antibody concentration/titer was greater than or equal to the assay cut-off.
- A seroprotected subject was a subject whose antibody concentration/titer was greater than or equal to the level defining clinical protection. The following seroprotection thresholds were applicable:
  - Anti-diphtheria antibody concentrations ≥ 0.1 IU/mL.
  - Anti-tetanus antibody concentrations ≥ 0.1 IU/mL.
  - Anti-HBs antibody concentrations ≥ 10 mIU/mL.
  - Anti-poliovirus types 1, 2 and 3 antibody titers ≥ 8.
  - Anti-PRP antibody concentrations ≥ 0.15 µg/mL.
- Other cut-offs were to be considered:
  - Anti-PRP antibody concentrations ≥ 1.0 µg/mL.
  - Anti-diphtheria and anti-tetanus antibody concentrations ≥ 1.0 IU/mL
- Booster responses for anti-PT, anti-FHA and anti-PRN antibodies were defined as:
  - initially seronegative subjects (pre-booster antibody concentration below the assay cut-off) presenting an increase of at least four times the assay cut-off one month after vaccination;
  - initially seropositive subjects with antibody concentration < four times the assay cut-off presenting an increase of at least four times the pre-booster antibody concentration one month after vaccination;
  - initially seropositive subjects with anti-body concentration ≥ four times the assay cut-off presenting an increase of at least two times the pre-booster antibody concentration one month after vaccination.

- The GMC/geometric mean titer (GMT) calculations were performed by taking the anti-log of the mean of the log_{10} titer/ concentration transformations. Antibody titers/concentrations below the cut-off of the assay were given an arbitrary value of half the cut-off for the purpose of GMC/GMT calculation.
- Handling of missing data - For a given subject and a given immunogenicity measurement, missing or non-evaluable measurements were not to be replaced.

5.10.5.3. Safety/reactogenicity:

- For a given subject and the analysis of solicited symptom within 4 days post-vaccination, missing or non-evaluable measurements were not to be replaced. Therefore the analysis of the solicited symptoms based on the Total Vaccinated cohort was to include only vaccinated subjects and doses with documented safety data (i.e. symptom screen completed).
- For analysis of unsolicited adverse events, such as serious adverse events or adverse events by primary MedDRA term, and for the analysis of concomitant medications, all vaccinated subjects were considered. Subjects who did not report the event or the concomitant medication were considered as subjects without the event or the concomitant medication, respectively.
- For analysis of convulsion, the adverse event was to be identified by using narrow standard MedDRA query.
- For analysis of Hypotonic Hyporesponsive Episode (HHE), the adverse event was identified by using broad standard MedDRA query.
- For analysis of NOCI, the adverse event was identified by using narrow standard MedDRA query.
- For summaries reporting both solicited and unsolicited adverse events, all vaccinated subjects were considered. Subjects for whom the event was not reported were considered as subjects without the event.
- Large injection site reactions were defined as either swelling with a diameter of >50 mm or a >50 mm increase in the circumference of any limb when compared to the baseline (pre-vaccination) measurement, or any diffuse swelling that interferred with or prevented everyday activities (for example, active playing, eating, sleeping).

5.10.6. Final analysis of the Epoch 001

5.10.6.1. Analysis of demographics

Demographic characteristics (age [weeks], gender, geographical ancestry, height in length [cm], weight [kg] at first dose, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status were summarised by group using descriptive statistics:

- Frequency tables were generated for categorical variables such as center;
- Mean, median and standard error were provided for continuous data such as age.

The distribution of subjects enrolled among the study sites was tabulated as a whole and per group.

5.10.6.2. Analysis of immunogenicity

The primary analysis was based on the Primary ATP cohort for immunogenicity. An analysis on the Primary Total Vaccinated cohort was performed only if, in any vaccine group and at any time point, more than 5% of the vaccinated subjects with immunological data post-dose 3 were excluded from the Primary ATP cohort for immunogenicity.

The following sections describe the analyses that were performed.

5.10.6.2.1. Within group assessment

For each group, one month post-dose 3 and for each assay for which a serological result was available:

- Seropositivity and seroprotection rates with exact 95% CIs were calculated.
- GMCs/GMTs with 95% CIs were tabulated.
- For each antigen, antibody concentration or titer distribution one month post-vaccination was tabulated and displayed using reverse cumulative curves (RCCs).
- For anti-PRP post primary vaccination at Visit 4 using the qualified assay and the fully validated assay, seropositivity and seroprotection rates and GMCs were calculated per *Infanrix hexa* lot.

All the above within group analysis for Epoch 001, except the reverse cumulative curves and the presentation per *Infanrix hexa* lot, were also to be performed by gender, by geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry), by Tdap vaccination history of mothers during pregnancy and by Hepatitis B vaccination of the subjects at birth (for anti-HBs antigen).

5.10.6.2.2. Between group assessment

At one month post-dose 3,

- The asymptotic standardized 95% CI for the group difference (Pedia group minus Hexa group and Penta group minus Hexa group) in the seroprotection rates was computed for each antigen.

Antigen	Threshold considered for protection
• Anti-D	• 0.1 IU/mL (short term protection) • 1.0 IU/mL (long term protection)
• Anti-T	• 0.1 IU/mL (short term protection) • 1.0 IU/mL (long term protection)
• Anti-polio	• 8 dilution
• Anti-PRP	• 0.15 µg/mL (short term protection) • 1.0 µg/mL (long term protection)
• Anti-HBs	• 10 mIU/mL

- The 95% CI for each group GMC/GMT ratio (Pedia group divided by Hexa group and Penta group divided by Hexa group) was computed using an Analysis of Variance (ANOVA) model on the logarithm-transformed concentrations/titers. The ANOVA model was to include the vaccine group as fixed effect and the Tdap vaccination of the mother during pregnancy as continuous regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B vaccine birth dose status was also to be used as regressor leading to an ANCOVA model. The model was to include the data from the 3 groups compared. For analysis purpose, DTP vaccination of the mother during pregnancy and Hepatitis B vaccination at birth were considered as continuous variables. More specifically 2 continuous indicator variables were to be used for Tdap vaccination of mother during pregnancy (an indicator for no Tdap vaccination at birth and an indicator for unknown vaccination at birth) while one indicator of hepatitis B vaccination at birth was used.

5.10.6.2.3. Interpretation of analyses

Except for analyses addressing criteria specified in the primary objective, comparative analyses were descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses were not to be interpreted for formal conclusions since there was no adjustment for multiplicity of endpoints.

5.10.6.3. Analysis of safety

The primary analysis was based on the primary Total Vaccinated cohort. If, in any vaccine group and at any time point of the Epoch 001, the percentage of vaccinated subjects excluded from the primary ATP cohort for safety was more than 5%, a second

analysis based on the primary ATP cohort for safety was to be performed to complement the primary Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) or 31-day (Days 0-30) follow-up period was tabulated after each vaccine dose and overall (for the Epoch 001) with exact 95% CI.
- The percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 4-day or 31-day follow-up period was tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses with local AEs (solicited and unsolicited) were calculated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines, as well as overall (all sites considered) during the 4-day follow-up period was tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses reporting each individual solicited local and general AE during the 4-day follow-up period were tabulated for each group as follows:
  - Over the primary doses, the percentage of subjects with the symptom and its exact 95% CI.
  - Over the primary doses, the percentage of doses with the symptom and its exact 95% CI.
  - At each study dose, the percentage of subjects with the symptom and its exact 95% CI.

  The exact 95% CIs were calculated assuming independence between doses.
- All computations mentioned above were done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit. The percentage of subjects/doses reporting each individual solicited local symptom (any grade, grade 2, grade 3, medical advice) during the 4-day follow-up period were also to be tabulated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines with exact 95% CI after each vaccine dose and overall where the same row on the table was used for all vaccines given at the same site across the three study groups (e.g. *Infanrix hexa*, *Pentacel* and *Pediarix* together were in one row and *ActHIB* and *Engerix-B* together were in one row). The percentage of subjects/doses reporting each individual general solicited symptom (any grade, Grade ≥2, Grade 3, causally related, Grade 3 causally related, medical advice) during the 4-day follow-up period were also to be tabulated with exact 95% CI. For fever, the analyses were also to be performed by 0.5°C increments.

- The percentage of subjects/doses with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination was tabulated after each dose and over the Epoch 001.
- The verbatim reports of unsolicited AEs were reviewed by a Clinical Research and Development Lead and the signs and symptoms were coded according to MedDRA. Every verbatim term was matched with the appropriate Preferred Term. The percentage of subjects/doses with unsolicited AEs occurring within 31 days with exact 95% CI was tabulated by Preferred Term. Similar tabulations were done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.
- Subjects who experienced AEs of specific interest (i.e. convulsions, Hypotonic Hyporesponsive Episode) during 31 days with exact 95% CI were tabulated by Preferred Term. Similar tabulations were done for AEs considered related to vaccination. Subjects who experienced AEs of specific interest were also to be described in detail.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to 6 months after the last primary vaccination were tabulated by Preferred Term.
- Subjects who experienced at least one SAE with onset from Dose 1 up to six months post primary vaccination were tabulated with MedDRA primary preferred term.
- All reactogenicity analyses and analyses for unsolicited symptoms were also to be performed by gender and geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry).

5.10.7. Final analysis of the Epoch 002

5.10.7.1. Analysis of demographics/baseline characteristics

Demographic characteristics (age [months] at Visit 5, gender, geographical ancestry, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status were summarized by group using descriptive statistics:

- Frequency tables were generated for categorical variables such as race/ethnicity;
- Mean, median and standard error were provided for continuous data such as age.

The distribution of subjects vaccinated at Visit 5 among the study sites was tabulated as a whole and per group.

For enrolled subjects that did not participate in the Epoch 002, the reason for not participating was summarized.

5.10.7.2. Analysis of immunogenicity

The primary analysis was based on the booster ATP cohort for immunogenicity. An analysis on the booster Total Vaccinated cohort was to be performed only if, in any vaccine group and at any time point of the Epoch 002, more than 5% of the vaccinated subjects with immunological data were excluded from the booster ATP cohort for immunogenicity.

The following section describes the analyses that were performed.

5.10.7.2.1. Within group assessment

For each group, prior to the booster dose and one month post-booster dose and for each assay, for which a serological result was available:

- Seropositivity and seroprotection rates and booster response rates for pertussis with exact 95% CIs were calculated.
- GMCs/GMTs with 95% CIs were tabulated.
- For each antigen, antibody concentration or titer distribution before and one month Post-booster (when available) were tabulated and displayed using RCCs.

All the above within group analysis for Epoch 002 except the reverse cumulative curves were also to be performed by gender, by geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry), by Tdap vaccination history of mothers during pregnancy and Hepatitis B vaccination of the subjects at birth (for anti-HBs antigen).

5.10.7.2.2. Between group assessment

At pre-booster and at one month post-booster,

- The asymptotic standardized 95% CI for the group difference (Pedia group minus Hexa group and Penta group minus Hexa group) in the seroprotection rates was computed for each antigen except for group difference (Penta group minus Hexa group).

Antigen	Threshold considered for protection
• Anti-D	• 0.1 IU/mL (short term protection) • 1.0 IU/mL (long term protection)
• Anti-T	• 0.1 IU/mL (short term protection) • 1.0 IU/mL (long term protection)
• Anti-polio (Pre-Booster)	• 8 dilution
• Anti-PRP	• 0.15 µg/mL (short term protection) • 1.0 µg/mL (long term protection)
• Anti-HBs (Pre-Booster)	• 10 mIU/mL

- The 95% CI for each group GMC/GMT ratio (Pedia group divided by Hexa group and Penta group divided by Hexa group) were computed using an ANOVA model on the logarithm-transformed concentrations/titers. The ANOVA model was to include the vaccine group as fixed effect and the Tdap vaccination of the mother during pregnancy as regressor leading to an ANCOVA. For hepatitis B antigen, the hepatitis B vaccine birth dose status was also to be used as regressor leading to an ANCOVA model. The model was also to include the data from the 3 groups compared. For analysis purpose, DTP vaccination of the mother during pregnancy and Hepatitis B vaccination at birth were considered as continuous variables. More specifically 2 continuous indicator variables were used for Tdap vaccination of mother during pregnancy (an indicator for no Tdap vaccination at birth and an indicator for unknown vaccination at birth) while one indicator of hepatitis B vaccination at birth was used.

5.10.7.2.3. Interpretation of analyses

In Epoch 002, all comparative analyses were descriptive/exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses were not to be interpreted for formal conclusions since there was no adjustment for multiplicity of endpoints.

5.10.7.3. Analysis of safety

The primary analysis for the Epoch 002 was based on the booster Total Vaccinated cohort and was only to look at the booster dose. If, in any vaccine group, the percentage of vaccinated subjects excluded from the booster ATP cohort for safety was more than 5%, a second analysis based on the booster ATP cohort for safety was to be performed to complement the booster Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period after the booster dose, were tabulated with exact 95% CI for each group.
- The incidence of local AEs (solicited and unsolicited) was calculated at each injection site as well as overall (all sites considered) for each group during the 4-day (Days 0-3) follow-up period after the booster dose.
- The percentage of subjects reporting each individual solicited local and general AE during the 4-day follow-up period was tabulated with its exact 95% CI for each group.
- All computations mentioned above were to be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit. The percentage of subjects reporting each individual solicited local symptoms (any grade, Grade ≥2, Grade 3, medical advice) during the 4-day follow-up period were also to be tabulated at each injection site for *Infanrix, Hiberix, ActHIB* and *Pentacel*

vaccines with exact 95% CI after each vaccine dose and overall where vaccination with same vaccine site was considered together (e.g. *Infanrix* and *Pentacel* together were on one row and *ActHIB* and *Hiberix* together were on one row). The percentage of subjects reporting each individual general solicited symptom (any grade, Grade ≥2, Grade 3, causally related, Grade 3 causally related, medical advice) during the 4-day follow-up period was also to be tabulated with exact 95% CI. For fever, analyses were also to be performed by 0.5°C increments.

- The percentage of subjects with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination were tabulated for each group.
- The verbatim reports of unsolicited AEs were reviewed by a Clinical Research and Development Lead and the signs and symptoms were coded according to MedDRA. Every verbatim term was matched with the appropriate Preferred Term. The percentage of subjects with unsolicited AEs occurring within 31 days following the booster dose with its exact 95% CI was tabulated by Preferred Term. Similar tabulations were done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.

Additionally,

- Any large injection site reaction (defined as a swelling with a diameter > 50 mm, noticeable diffuse swelling or increase in limb circumference of greater than 50 mm) reported within 4 days (Days 0-3) following the booster dose was to be tabulated.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from booster dose up to one month after booster vaccination were tabulated by Preferred Term.
- Subjects who experienced at least one SAE from the booster dose up to one month after were tabulated with MedDRA primary preferred term. The same summary was provided for all SAEs reported from dose 1 up to study end.

All reactogenicity analyses and analyses for unsolicited symptoms were also to be performed by gender and geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestry, namely White Caucasian versus any other geographical ancestry).

5.10.8. Sequence of analyses

The analyses were performed stepwise:

1. A partial analysis of Epoch 001 up to one month after the third primary vaccine dose was conducted. This analysis included the final analysis of anti-PRP, solicited and unsolicited symptoms on data as clean as possible. This analysis was displayed on the GSK clinical trial registry.
2. The final data analysis of the study covering both the epochs was conducted at the end of the study. All these analyses are presented in an integrated final clinical study report.

5.10.9. Interim analysis

All analyses were conducted on final data and therefore no statistical adjustment for interim analyses was required – see Section 5.10.8 and first bullet point for details of the interim analysis.

5.11. Data quality assurance at study level

To ensure that the study procedures conformed across all investigator sites, the protocol, eCRF and safety reporting were reviewed with the investigator(s) and his/her/their personnel responsible for the conduct of the study by the Company representative(s) prior to study start. A multi-investigator meeting was held on 05-06 March 2014 Face to Face in Dallas, Texas, USA, prior to the study start.

Adherence to the protocol requirements and verification of data generation accuracy were achieved through monitoring visits to each investigator site**.** Computer checks and blinded review of subject tabulations were performed to ensure consistency of eCRF completion. All procedures were performed according to methodologies detailed in GSK Biologicals Standard Operating Procedures (SOPs).

All protocol deviations collected during the study were reviewed by the GSK study team in order to identify important protocol deviations. Consistent with International Conference on Harmonisation E3 guidance, important deviations are defined as deviations that were likely to affect the interpretation of the results and/or led to exclusion of any subject data from an analysis. Important deviations include, but are not limited to, those related to study inclusion or exclusion criteria, adherence to the protocol, conduct of the study, subject management or subject assessment.

The Table in Section 2 summarises the roles of the different CROs that were employed in this study. The CRO responsibilities were conducted according to SOPs agreed between GSK and the CRO.

Independent Audit statement:

- This study was subject to audit by GlaxoSmithKline's R&D Global Quality Compliance (GQC) - Clinical Development Quality Assurance. (CDQA) department.

5.12. Changes in the conduct of the study or planned analyses

5.12.1. Protocol amendments

5.12.1.1. Protocol Amendment 1

Protocol Amendment 1 was implemented at all study sites from the date of approval on 18-September-2014 onwards.

Rationale/background for changes:

- Clarification was provided that large injection site reactions and measurement of the injected limb was to be collected as a solicited symptom. Specific instructions regarding measurement of limb circumference and clinical details of large injection site reactions were added.
- Additional minor clarifications of study procedures and data analyses were made throughout the document.
- Instructions regarding interval between preparation and administration of vaccine was aligned with the stability data described in the current Investigator Brochure.
- Due to ongoing re-validation of serological assays for antibodies to diphtheria and tetanus toxoids, pertussis antigens, poliovirus, hepatitis B surface antigen and polyribosyl ribitol phosphate, the cut-offs for these assays could potentially change and hence a note was added in the protocol regarding this. The definition of booster response to pertussis antigens could also potentially have been revised.
- Sequence of reporting the results was clarified.
- The contributing authors and sponsor signatory were updated to reflect changes in the study team.

5.12.1.2. Protocol Amendment 2

Protocol Amendment 2 was implemented at all study sites from the date of approval on 17-April-2015 onwards.

Rationale/background for changes:

- The assay for testing antibodies against polyribosyl ribitol phosphate (anti-PRP) was re-developed but was not yet qualified or validated for testing the one month post dose-3 samples. This was clarified in the protocol in Table 7 Humoral immunity (antibody determination) and Section 5.7.3 Laboratory assays.
- Investigator sign-off on the patient identification (PIDS) was done after Visit 4 instead of ESFU. In Table 4 List of study procedures, the bullets pertaining to investigator sign-off and analysis of Epoch 001 were removed from the ESFU visit and retained at Visit 4 to reflect this change.
- The collection of baseline measurement of limb length was removed since it was not to be used in analysis; only limb circumference was used in the analysis. Accordingly, text related to this was amended in Table 4 List of study procedures, Sections 5.6.2.11, Baseline measurement of limb circumference after booster vaccination at Visit 5 and 5.6.2.13 Recording of AEs, SAEs and NOCIs.
- Errors in the vaccines dictionary of Study Master Repository were rectified for *Infanrix hexa*, *Pediarix* and *Pentacel* vaccines. The corresponding correction was made in Table 9 Study vaccines.
- The sequence of analysis in Section 10.9.1 Sequence of analyses, was amended to reflect that there would first be an analysis of immunogenicity for anti-PRP and safety for Epoch 001, followed by a final analysis covering both Epochs at the end of the study.

5.12.2. Other changes

5.12.2.1. Changes in the Statistical Analysis Plan (SAP) from the protocol

- During the course of the study, the assays used to measure the anti-D, -T, -PRP, -PT, -FHA and -PRN IgG concentrations were re-developed and re-validated and both assay units and assay cut-offs were adapted. The new ELISAs for PT, FHA and PRN were calibrated against the WHO International Standard (NIBSC 06/140). This allowed the expression of concentrations measured with the new ELISAs in International Units per milliliter (IU/mL) instead of the formerly used ELISA units per milliliter (EL.U/mL). The newly validated DTPa ELISA's had a lower assay cut-offs as compared to the ones described in the protocol. The current assay cut-off was 0.057 IU/mL for anti-D, 0.043 IU/mL for anti-T, 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA, 2.187 IU/mL for anti-PRN and 0.066 µg/mL for the fully validated anti-PRP assay.
- Since for anti-D and anti-T, a threshold of 0.1 IU/mL provided a conservative estimate of the percentage of subjects deemed to be protected, the anti-D, anti-T seropositivity endpoints initially defined by the previous assay cut-off of 0.1 IU/mL were replaced by seroprotection rate endpoints defined as the percentage of subjects with concentration above 0.1 IU/mL.
- In the absence of a correlate of protection for the *B. pertussis* antigens, the pertussis vaccine response endpoints were redefined based on the assay cut-off (see Section 5.10.1 and 5.10.2 for the definition of the endpoints).
- Subgroup analyses by gender and geographical ancestry was added for summaries of solicited symptoms and for summaries of unsolicited symptoms.
- During the review of protocol deviations, hemolysed samples were identified among blood samples obtained one month post dose 3. Not knowing the impact on the anti-HBs assay the samples were conservatively excluded from the Primary ATP cohort for immunogenicity analyses of anti-HBs. This concerned 36 subjects (14 in the Penta group and 11 in each of Pedia and Hexa groups).
- A descriptive summary per lot was added for anti-PRP post priming.
- The ANCOVA model was revised to include the 3 study groups rather than the 2 groups compared. This allowed identical adjusted GMC estimates regardless of the groups involved in the comparison.
- The DTPA-HBV-IPV-135 (117119) Abridged Interim Report Main (19-Oct-2015) included immunogenicity data against PRP antigen at Visit 4 using an assay which was not fully validated. For the final analysis, the Visit 4 samples were retested together with the samples pre- and post-booster using a newly validated assay. In the final analysis, the results of both assays are descriptively presented at Visit 4.
- Analyses of HHE within the 31-day (Days 0-30) post-vaccination period and of convulsion within 31-day (Days 0-30) post vaccination were added following a request from CBER [GlaxoSmithKline Vaccines, 2014].
- The distribution of vaccinated subjects by center and the summary of reason for withdrawal were performed for the full study rather than by Epoch.

6. STUDY POPULATION RESULTS

6.1. Study dates

Primary vaccination epoch

The first subject was enrolled in the primary vaccination study on 16-April-2014 and the last visit for the primary epoch took place on 31-March-2015. The last contact (ESFU) of the primary vaccination epoch was made on 12-August-2015.

Booster vaccination epoch

The first subject first visit for the Booster vaccination epoch was on 14-May-2015 and the last contact (ESFU) of the booster vaccination epoch was made on 13-November-2015.

6.2. Subject disposition

The number of subjects enrolled in the study at each centre is presented in Table 6.1. The deviations from specifications for age and intervals between study visits is presented in Table 6.5 (Primary Total vaccinated cohort) and Table 6.6 (Booster Total vaccinated cohort).

Table 17 represents the number of subjects who were vaccinated, completed and withdrawn at visit 6 (Month 14-17) with reason for withdrawal from the study.

A total of 585 subjects were vaccinated and 476 subjects completed the study. The most frequent reasons for withdrawal were: migrated/moved from the study area (21 subjects) and consent withdrawal (not due to an AE; 20 subjects).

Table 17 Number of subjects vaccinated, completed and withdrawn at visit 6 (Month 14-17) with reason for withdrawal (Primary Total vaccinated cohort)

	Hexa group	Pedia group	Penta group	Total
Number of subjects vaccinated	195	194	196	585
Number of subjects completed	161	158	157	476
Number of subjects withdrawn	34	36	39	109
Reasons for withdrawal :				
Subject died	0	0	0	0
Serious Adverse Event	1	0	0	1
Non-Serious Adverse Event	0	0	1	1
Eligibility criteria not fulfilled (inclusion and exclusion criteria)	0	0	0	0
Protocol violation	7	2	8	17
Consent withdrawal (not due to an adverse event)	5	7	8	20
Migrated/moved from study area	6	10	5	21
Lost to follow-up (subjects with incomplete vaccination course)	5	8	6	19
Lost to follow-up (subjects with complete vaccination course)	3	0	4	7
Sponsor study termination	0	0	1	1
Other - change their doctor	1	0	0	1
Other - loss of kaiser coverage	3	8	2	13
Other - medical history updated information	0	1	0	1
Other - received vaccines in injection clinic	0	0	1	1
Other - refuses blood draws	0	0	1	1
Other - subject got a new doctor	1	0	0	1
Other - subject unable to complete visit 5 during the gsk shortened window for visit 5	0	0	1	1
Other - subject was discontiued due to non-compliance	0	0	1	1
Other - terminated by pi due to non-compliance with appointment schedules	1	0	0	1
Other - unknown	1	0	0	1

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
Vaccinated = number of subjects who were vaccinated in the study
Completed = number of subjects who completed last study visit
Withdrawn = number of subjects who did not come back for the last visit
pi = Principal Investigator

6.3. Important Protocol deviations at subject level

6.3.1. Protocol Deviations leading to elimination from ATP analyses

The details on number of subjects excluded from Primary ATP analysis with reasons for exclusion are presented in Table 18.

For Hepatitis B / anti-HBs analysis, hemolysed samples were excluded from the Primary ATP cohort for immunogenicity – see Section 5.12.2.1 for further details of which subjects were excluded.

The details on number of subjects excluded from Booster ATP analysis with reasons for exclusion are presented in Table 19.

Table 18 Number of subjects enrolled into the study as well as number excluded from Primary ATP analyses with reasons for exclusion

	Total			Hexa group		Pedia group		Penta group	
Title	**n**	**s**	**%**	**n**	**s**	**n**	**s**	**n**	**s**
Primary Total vaccinated cohort	585		100	195		194		196	
Administration of vaccine(s) forbidden in the protocol (code 1040)	7	7		1	1	1	1	5	5
Study vaccine dose not administered according to protocol (code 1070)	0	2		0	0	0	0	0	2
ATP cohort for safety	578		98.8	194		193		191	
Underlying medical condition forbidden by the protocol (code 2050)	2	2		0	0	0	0	2	2
Concomitant infection related to the vaccine which may influence immune response (code 2060)	0	2		0	0	0	0	0	2
Non compliance with vaccination schedule (including wrong and unknown dates) (code 2080)	19	20		5	5	8	8	6	7
Non compliance with blood sampling schedule (including wrong and unknown dates (code 2090)	6	9		4	6	2	3	0	0
Essential serological data missing (code 2100)	85	93		31	34	27	27	27	32
ATP cohort for immunogenicity *	466		79.7	154		156		156	

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
Note: Subjects may have more than one elimination code assigned
n = number of subjects with the elimination code assigned excluding subjects who have been assigned a lower elimination code number
s = number of subjects with the elimination code assigned
% = percentage of subjects in the considered ATP cohort relative to the Primary Total vaccinated cohort
* Subjects with hemolysed samples were excluded from the Primary ATP cohort for immunogenicity – see Section 5.12.2.1 for further details of which subjects were excluded.

Table 19 Number of subjects who received a booster dose as well as number excluded from Booster ATP analyses with reasons for exclusion

	Total			Hexa group		Pedia group		Penta group	
Title	**n**	**s**	**%**	**n**	**s**	**n**	**s**	**n**	**s**
Booster Total vaccinated cohort	486		100	167		158		161	
Administration of vaccine(s) forbidden in the protocol (code 1040)	1	1		0	0	0	0	1	1
ATP cohort for safety	485		99.8	167		158		160	
Administration of any medication forbidden by the protocol (code 2040)	2	2		0	0	0	0	2	2
Non compliance with vaccination schedule (including wrong and unknown dates) (code 2080)	6	6		4	4	0	0	2	2
Non compliance with blood sampling schedule (including wrong and unknown dates (code 2090)	17	17		8	8	2	2	7	7
Essential serological data missing (code 2100)	52	57		17	20	17	17	18	20
ATP cohort for immunogenicity	408		84.0	138		139		131	

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
Note: Subjects may have more than one elimination code assigned
n = number of subjects with the elimination code assigned excluding subjects who have been assigned a lower elimination code number
s = number of subjects with the elimination code assigned
% = percentage of subjects in the considered ATP cohort relative to the Booster Total vaccinated cohort

6.3.2. Protocol Deviations not leading to elimination from ATP analyses

None

6.4. Demographic characteristics and other baseline characteristics

The demographic characteristics are summarised for the Primary ATP cohort for immunogenicity in Table 20 and for the Booster ATP cohort for immunogenicity in Table 21.

In the Primary ATP cohort for immunogenicity, the mean age of the subjects was 8.6 weeks at the time of first vaccination (SD = 1.0; Table 20). There were more males (52.8%) compared to females (47.2%). The majority of the subjects were of White - Caucasian / European Heritage (62.9%), with African Heritage / African American (8.2%) and American Indian or Alaskan Native (7.7%) racial categories being the next two most frequent categories.

In the Booster ATP cohort for immunogenicity, the mean age of the subjects was 15.3 months at the time of vaccination (SD = 0.7; Table 21). There were more males (56.6%) compared to females (43.4%). The distribution of Booster phase subjects in the racial categories remained similar to the corresponding Primary cohort.

7. IMMUNOGENICITY RESULTS

The primary analysis of immunogenicity was performed on the Primary ATP cohort for analysis of immunogenicity and the Booster ATP cohort for analysis of immunogenicity. Refer to Section 5.10.4 for the definition of the cohorts identified for analyses.

7.1. Primary Vaccination Epoch

7.1.1. Non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB* - Immunogenicity of study vaccine pertussis antigens (PT, FHA and PRN)

The primary objective to demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens (PT, FHA and PRN) one month after the third dose of the primary vaccination was reached (Table 22) – see Section 4.1.1 for the definition of the primary objective.

For each of the three pertussis antigens, the upper limit of the 95% confidence interval (CI) for the GMC ratio [Pedia group divided by Hexa group] was ≤ 1.5 (Table 22):

- For anti-PT antibody – 1.31;
- For anti-FHA antibody – 1.35;
- For anti-PRN antibody – 0.99.

Table 22 Ratio of GMCs for anti-PT, anti-FHA and anti-PRN between groups (Pedia group divided by Hexa group), one month post primary vaccination (Primary ATP cohort for immunogenicity)

					Adjusted GMC ratio (Pedia group / Hexa group)		
	Pedia group		Hexa group			95% CI	
Antibody	N	Adjusted GMC	N	Adjusted GMC	Value	LL	UL
anti-PT antibody (IU/mL)	149	47.9	146	43.6	1.10	0.92	1.31
anti-FHA antibody (IU/mL)	149	122.6	146	107.3	1.14	0.97	1.35
anti-PRN antibody (IU/mL)	149	46.1	146	58.2	0.79	0.63	0.99

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
Adjusted GMC = geometric mean antibody concentration adjusted for Tdap vaccination of the mother
N = Number of subjects with both pre- and post-primary vaccination results available
95% CI = 95% confidence interval for the adjusted GMC ratio (ANCOVA model: adjustment for Tdap vaccination of mother - pooled variance); LL = lower limit, UL = upper limit

7.1.2. Immune response to the Primary vaccinations

7.1.2.1. Anti-Pertussis (PT, FHA, PRN) antibody responses

The percentage of subjects with anti-PT, anti-FHA and anti-PRN antibody concentrations ≥ the assay cut-off and GMC are presented in Table 23.

One month after primary vaccination for subjects in the Hexa, Pedia and Penta groups:

- At least 99.3% of subjects had anti-PT antibody concentrations ≥2.693 IU/mL (assay cut-off) and also anti-PRN antibody concentrations ≥2.187 IU/mL (assay cut-off).
- All subjects had an anti-FHA antibody concentrations ≥2.046 IU/mL (assay cut-off).
- GMC values across the three groups ranged for anti-PT antibody from 24.2-48.3, for anti-FHA antibody from 59.9-122.7, and for anti-PRN antibody from 33.0-57.4.

Table 23 Number and percentage of subjects with anti-PT, anti-FHA and anti-PRN antibody concentration equal to or above the assay cut-off and geometric mean concentration (GMC), one month post primary vaccination (Primary ATP cohort for immunogenicity)

				≥ assay cut-off				GMC

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
GMC = geometric mean antibody concentration calculated on all subjects
N = number of subjects with available results
n/% = number/percentage of subjects with concentration equal to or above specified value
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
PIII(M5) = Post primary vaccine dose 3 at month 5 (Visit 4)
Note: The assay cut off is 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA, and 2.187 IU/mL for anti-PRN.

The corresponding data is also presented by gender (Table 7.1), geographical ancestry (Table 7.2) and Tdap vaccination of mother (Table 7.3).

Reverse cumulative distribution curves for anti-PT concentrations one month post primary vaccination is provided in Figure 7.1, with corresponding curves for anti-FHA concentrations in Figure 7.2, and anti-PRN concentrations in Figure 7.3.

7.1.2.2. Anti-Diphtheria (D) and anti-Tetanus (Anti-T) antibody responses

The percentage of subjects with anti-D and anti-T antibody concentrations ≥ the assay cut-off, ≥ 0.1 IU/mL, ≥ 1.0 IU/mL and GMC are presented in Table 24.

One month after primary vaccination for subjects in the Hexa, Pedia and Penta groups:

- All subjects had anti-D antibody concentrations ≥ 0.1 IU/mL and at least 99.3% of subjects had anti-T antibody concentrations ≥ 0.1 IU/mL, which were the protocol-defined levels of seroprotection against these diseases (see Section 5.8.4 and 5.10.5.2).

The corresponding data is also presented by gender (Table 7.4), geographical ancestry (Table 7.5) and Tdap vaccination of mother (Table 7.6).

Reverse cumulative distribution curves for anti-D concentrations one month post primary vaccination is provided in Figure 7.4, with a corresponding curve for anti-T concentrations in Figure 7.5.

Table 24 Number and percentage of subjects with anti-D and anti-T antibody concentration equal to or above the assay cut-off, 0.1 IU/mL and 1.0 IU/mL and geometric mean concentration (GMC), one month post primary vaccination (Primary ATP cohort for immunogenicity)

95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
PIII(M5) = Post primary vaccine dose 3 at month 5 (Visit 4)
Note: The assay cut off is 0.057 IU/mL for anti-D, 0.043 IU/mL for anti-T.

7.1.2.3. Anti-Polio 1, 2, and 3 antibody responses

The percentage of subjects with anti-Polio 1, 2, and 3 antibody titer ≥ 8 - the protocol-defined seroprotection level (see Section 5.8.4 and 5.10.5.2) and GMT are e presented in Table 25.

One month after primary vaccination for subjects in the Hexa, Pedia and Penta groups:

- At least 99.3% of subjects had anti-Polio 1 antibody titer ≥8,
  all subjects had anti-Polio 2 antibody titer ≥8 and
  at least 98.4% of subjects had anti-Polio 3 antibody titer ≥8.

The corresponding data is also presented by gender (Table 7.7), geographical ancestry (Table 7.8) and Tdap vaccination of mother (Table 7.9).

Reverse cumulative distribution curves for anti-Polio 1 titres one month post primary vaccination is provided in Figure 7.6, with corresponding curves for anti-Polio 2 titres in Figure 7.7 and anti-Polio 3 titres in Figure 7.8.

PIII(M5) = Post primary vaccine dose 3 at month 5 (Visit 4)

7.1.2.4. Anti-PRP antibody responses

The percentage of subjects with anti-PRP antibody concentrations ≥ the assay cut-off, ≥ 0.1 µg/mL, ≥ 1.0 µg/mL and GMC are presented in Table 26.

One month after primary vaccination for subjects in the Hexa, Pedia and Penta groups:

- Short-term seroprotection against *Haemophilus influenzae* type b disease is defined as an anti-PRP antibody concentrations ≥ 0.15 µg/mL (see Section 5.8.4 and 5.10.5.2). This level of seroprotection was reached by at least 94.0% of subjects across the groups using the qualified assay and at least 94.8% across groups using the fully validated assay.

Table 26 Number and percentage of subjects with anti-PRP antibody concentration equal to or above the assay cut-off, 0.15 µg/mL and 1.0 µg/mL and geometric mean concentration (GMC), one month post primary vaccination (Primary ATP cohort for immunogenicity)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
GMC = geometric mean antibody concentration calculated on all subjects
N = number of subjects with available results
n/% = number/percentage of subjects with concentration equal to or above specified value
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
PIII(M5) = Post primary vaccine dose 3 at month 5 (Visit 4)
Note: Two assays were used for anti-PRP, for the fully validated assay, the assay cut off is 0.066 µg/mL while 0.15 µg/mL was used for the qualified assay.

The corresponding data is also presented by study lot (Table 7.10), by gender (Table 7.11), geographical ancestry (Table 7.12) and Tdap vaccination of mother (Table 7.13).

Reverse cumulative distribution curves for anti-PRP (fully validated assay) concentrations one month post primary vaccination is provided in Figure 7.9, with a corresponding curve for anti-PRP (qualified assay) concentrations in Figure 7.10.

7.1.2.5. Anti-HBs antibody responses

The percentage of subjects with anti-HBs antibody concentrations ≥ assay cut-off of 6.2 mIU/mL or seroprotection threshold of ≥ 10.0 mIU/mL and GMC are presented in Table 27.

One month after primary vaccination for subjects in the Hexa, Pedia and Penta groups:

- Seroprotection against Hepatitis B virus (HBV) disease is defined as anti-HBs antibody concentrations greater than or equal to 10 mIU/mL (see Section 5.8.4 and 5.10.5.2). This level of seroprotection was met by at least 97.8% of subjects across the groups.

  The results were re-presented this time by either receiving a HepB vaccination at birth or not (Table 28).

Table 27 Number and percentage of subjects with anti-HBs antibody concentration equal to or above 6.2 mIU/mL and 10.0 mIU/mL and geometric mean concentration (GMC), one month post primary vaccination (Primary ATP cohort for immunogenicity)

PIII(M5) = Post primary vaccine dose 3 at month 5 (Visit 4)

7.1.3. Primary Total Vaccinated cohort analysis

A total of 119 (20.3%) subjects, out of 585 vaccinated subjects were eliminated from the Primary ATP cohort for immunogenicity (466 subjects; Table 18). As more than 5% of the vaccinated subjects with immunological data post-dose 3 were excluded from the Primary ATP cohort for immunogenicity, a complementary analysis was carried out on the Primary Total Vaccinated cohort (see Section 5.10.6.2).

No apparent or clinically meaningful differences were observed between the immunogenicity results for the Primary Total Vaccinated cohort and the Primary ATP cohort for immunogenicity.

The results of the Primary Total Vaccinated cohort analyses are presented in Table 7.53 to Table 7.58.

7.2. Booster Vaccination Epoch

7.2.1. Immune response to the Booster vaccinations

7.2.1.1. Anti-Pertussis (PT, FHA, PRN) antibody persistence and booster response

The percentage of subjects with anti-PT, anti-FHA and anti-PRN antibody concentrations ≥ the assay cut-off and GMC are presented in Table 29.

Before the Booster vaccination for subjects in the Hexa, Pedia and Penta groups:

- Between 52.1-86.4% of subjects had anti-PT antibody concentrations ≥2.693 IU/mL, between 93.4-99.2% of subjects had anti-FHA antibody concentrations ≥2.046 IU/mL, and between 75.8-84.0% of subjects had anti-PRN antibody concentrations ≥2.187 IU/mL.
- The most pronounced anti-pertussis antibody levels decay (especially PT and FHA) between the primary and booster vaccinations is observed after *Pentacel+Engerix-B* vaccination.

One month after Booster vaccination for subjects in the Hexa, Pedia and Penta groups:

- All subjects had anti-PT antibody concentrations ≥2.693 IU/mL, all subjects had anti-FHA antibody concentrations ≥2.046 IU/mL, and all Pedia group subjects had anti-PRN antibody concentrations ≥2.187 IU/mL. The other anti-PRN antibody concentrations results were both above 99%.

The corresponding data is also presented by gender (Table 7.24), geographical ancestry (Table 7.25) and Tdap vaccination of mother (Table 7.26).

Reverse cumulative distribution curves for anti-PT concentrations, before and one month post booster vaccination is provided in Figure 7.12, with corresponding curves for anti-FHA concentrations in Figure 7.13, and anti-PRN concentrations in Figure 7.14.

Table 29 Number and percentage of subjects with anti-PT, anti-FHA and anti-PRN antibody concentration equal to or above the assay cut-off and geometric mean concentration (GMC), before and one month post booster vaccination (Booster ATP cohort for immunogenicity)

7.2.1.2. Booster responses for anti-PT, anti-FHA, and anti-PRN antibodies

The proportion of subjects with an anti-Pertussis antibody booster response was:

- For anti-PT antibody: ≥93.1% across groups;
- For anti-FHA antibody: ≥97.7% across groups;
- For anti-PRN antibody: ≥97.4% across groups (Table 30).

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines

Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines

Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine

Booster response to PT, FHA and PRN antigens is defined as:

S- subjects: For subjects with pre-vaccination antibody concentration below the assay cut off, post-vaccination antibody concentration ≥ 4 times the assay cut-off

S+ (<4*cut_off IU/mL) subjects: For subjects with pre-vaccination antibody concentration between the assay cut off and below 4 times the assay cut-off, post-vaccination antibody concentration equal or above 4 times the pre-vaccination antibody concentration

S+ (≥4*cut_off IU/mL) subjects: For subjects with pre-vaccination antibody concentration equal or above 4 times the assay cut off, post-vaccination antibody concentration equal or above 2 times the pre-vaccination antibody concentration
N = number of subjects with pre- and post-vaccination results available
n/% = number/percentage of subjects with booster response
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
Note: The assay cut off is 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA, and 2.187 IU/mL for anti-PRN.

The corresponding data is also presented by gender (Table 7.27), geographical ancestry (Table 7.28) and Tdap vaccination of mother (Table 7.29).

7.2.1.3. Anti-D and anti-T antibody persistence and booster response

The percentage of subjects with anti-D and anti-T antibody concentrations ≥ the assay cut-off, ≥ 0.1 IU/mL, ≥ 1.0 IU/mL and GMC are presented in Table 31.

Antibody persistence data before the Booster vaccination for subjects in the Hexa, Pedia and Penta groups:

- Between 93.2-97.7% of subjects had anti-D antibody concentrations ≥ 0.1 IU/mL and between 88.4-93.2% of subjects had anti-T antibody concentrations ≥ 0.1 IU/mL, which were the protocol-defined levels of seroprotection against these diseases.

One month after Booster vaccination for subjects in the Hexa, Pedia and Penta groups:

- All subjects had anti-D antibody concentrations and anti-T antibody concentrations ≥ 0.1 IU/mL, except for the Penta group for which anti-T antibody concentration was ≥ 0.1 IU/mL for 99.2% of subjects.
- The conservative level of ≥ 1.0 IU/mL seroprotection was exhibited for anti-D antibody by all subjects and for anti-T antibody by between 97.8-100% of subjects.

The corresponding data is also presented by gender (Table 7.30), geographical ancestry (Table 7.31) and Tdap vaccination of mother (Table 7.32).

Reverse cumulative distribution curves for anti-D concentrations, before and one month post booster vaccination is provided in Figure 7.15, with a corresponding curve for anti-T concentrations in Figure 7.16.

Table 31 Number and percentage of subjects with anti-D and anti-T antibody concentration equal to or above the assay cut-off, 0.1 IU/mL and 1.0 IU/mL and geometric mean concentration (GMC), before and one month post booster vaccination (Booster ATP cohort for immunogenicity)

Note: The assay cut off is 0.057 IU/mL for anti-D, 0.043 IU/mL for anti-T.

7.2.1.4. Anti-PRP antibody persistence and booster response

The percentage of subjects with anti-PRP antibody concentration ≥ 0.066 µg/mL, ≥ 0.15 µg/mL and ≥ 1.0 µg/mL and GMC are presented in Table 32.

Antibody persistence data before the Booster vaccination for subjects in the Hexa, Pedia and Penta groups:

- Between 69.5-92.4% of subjects had anti-PRP antibody concentrations ≥ 0.15 µg/mL, which indicated short-term seroprotection.
- Between 17.6-53.8% of subjects had anti-PRP antibody concentrations ≥ 1.0 µg/mL, which indicated long-term seroprotection.
- The most pronounced Anti-PRP antibody levels decay between the primary and booster vaccinations is observed after *Infanrix hexa* vaccination.

One month after Booster vaccination for subjects in the Hexa, Pedia and Penta groups:

- Between 98.5-100% of subjects had anti-PRP antibody concentrations ≥ 0.15 µg/mL.
- Between 97.7-99.3% of subjects had anti-PRP antibody concentrations ≥ 1.0 µg/mL.

The corresponding data is also presented by gender (Table 7.33), geographical ancestry (Table 7.34) and Tdap vaccination of mother (Table 7.35).

Reverse cumulative distribution curves for anti-PRP (fully validated assay) concentrations, before and one month post booster vaccination is provided in Figure 7.20.

Table 32 Number and percentage of subjects with anti-PRP antibody concentration equal to or above 0.066 µg/mL, 0.15 µg/mL and 1.0 µg/mL and geometric mean concentration (GMC), before and one month post booster vaccination (Booster ATP cohort for immunogenicity)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
GMC = geometric mean antibody concentration calculated on all subjects
N = number of subjects with available results
n/% = number/percentage of subjects with concentration equal to or above specified value
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
PRE-BST = Pre booster vaccination at Month 13-16 (Visit 5)
POST-BST = Post booster vaccination at Month 14-17 (Visit 6)

7.2.1.5. Anti-Polio antibody persistence

The percentage of subjects with anti-Polio 1, 2, and 3 antibody titers ≥ 8 – the protocol-defined seroprotection level (see Section 5.8.4 and 5.10.5.2) and GMT are e presented in Table 33.

Antibody persistence data at the Month 13-16 or Pre-Bst timepoint (Visit 5; Section 5.1.1) for the Hexa, Pedia and Penta groups:

- Between 86.2-96.9% of subjects had anti-Polio 1 antibody titer ≥8, between 93.0-95.3% of subjects had anti-Polio 2 antibody titer ≥8, and between 68.4-97.7% of subjects had anti-Polio 3 antibody titer ≥8.
- The most pronounced anti-polio antibody levels decay (especially polio 1 and polio 3) between the primary and booster vaccinations is observed after *Pentacel+Engerix-B* vaccination.

The corresponding data is also presented by gender (Table 7.36), geographical ancestry (Table 7.37) and Tdap vaccination of mother (Table 7.38).

Reverse cumulative distribution curves for anti-Polio 1 antibody titres before booster vaccination is provided in Figure 7.17, with corresponding curves for anti-Polio 2 titres in Figure 7.18 and anti-Polio 3 titres in Figure 7.19.

n/% = number/percentage of subjects with titer equal to or above specified value
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
PRE-BST = Pre booster vaccination at Month 13-16 (Visit 5)

7.2.1.6. Anti-HBs antibody persistence

The percentage of subjects with anti-HBs antibody concentration ≥ the assay cut-off of 6.2 mIU/mL or ≥ 10.0 mIU/mL which was the protocol-defined seroprotection level (see Section 5.8.4 and 5.10.5.2), and GMC are presented in Table 34.

Antibody persistence data at the Month 13-16 or Pre-Bst timepoint (Visit 5; Section 5.1.1) for the Hexa, Pedia and Penta groups:

- Between 86.8-98.5% of subjects had anti-HBs antibody concentrations ≥ 10.0 mIU/mL.
- The most pronounced anti-HBs antibody levels decay between the primary and booster vaccinations is observed after *Pentacel+Engerix-B* vaccination.

The corresponding data is also presented by gender (Table 7.39), geographical ancestry (Table 7.40), Tdap vaccination of mother (Table 7.41) and by Hepatitis B vaccination of subject (Table 7.42).

Reverse cumulative distribution curves for anti-HBs antibody concentrations before booster vaccination is provided in Figure 7.21.

PRE-BST = Pre booster vaccination at Month 13-16 (Visit 5)

7.2.2. Booster Total Vaccinated cohort analysis

A total of 78 (16.1%) subjects, out of 486 booster vaccinated subjects were eliminated from the Booster ATP cohort for immunogenicity (408 subjects; Table 19). As more than 5% of the booster vaccinated subjects with immunological data post-booster were excluded from the Booster ATP cohort for immunogenicity, a complementary analysis was carried out on the Booster Total Vaccinated cohort (see Section 5.10.7.2).

No apparent or clinically meaningful differences were observed between the immunogenicity results for the Booster Total Vaccinated cohort and the Booster ATP cohort for immunogenicity.

The results of the Booster Total Vaccinated cohort analyses are presented in Table 7.59 to Table 7.64.

7.3. Immunogenicity summary

7.3.1. Primary Vaccination Epoch

The primary objective to demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody GMCs for pertussis antigens (PT, FHA and PRN) one month after the third dose of the primary vaccination was reached:

- For PT, FHA and PRN, the upper limit of the 95% CI for the GMC ratio [Pedia group divided by Hexa group] was ≤ 1.5: For anti-PT antibody – 1.31; for anti-FHA antibody – 1.35; for anti-PRN antibody – 0.99.

- *Anti-Diphtheria and anti-Tetanus antibody responses:* All subjects had anti-D antibody concentrations ≥ 0.1 IU/mL and at least 99.3% of subjects had anti-T antibody concentrations ≥ 0.1 IU/mL, indicating seroprotection against these diseases.
- *Anti-Polio 1, 2, and 3 antibody responses:* At least 99.3% of subjects had anti-Polio 1 antibody titer ≥8, all subjects had anti-Polio 2 antibody titer ≥8 and at least 98.4% of subjects had anti-Polio 3 antibody titer ≥8.
- *Anti-PRP antibody responses:* Short-term seroprotection against *Haemophilus influenzae* type b disease (anti-PRP antibody concentrations ≥ 0.15 μg/mL) was met by at least 94.8% across groups using the fully validated assay.
- *Anti-HBs antibody responses:* Seroprotection against Hepatitis B virus (HBV) disease (anti-HBs ≥ 10 mIU/mL) was reached by at least 97.8% of subjects across the groups.

7.3.2. Booster Vaccination Epoch

- The proportion of subjects with an anti-Pertussis antibody booster response was:
  For anti-PT antibody: ≥93.1% across groups;
  for anti-FHA antibody: ≥97.7% across groups;
  for anti-PRN antibody: ≥97.4% across groups.
- *Anti-D and Anti-T immune response:* Seroprotection (≥ 0.1 IU/mL) was reached for at least 99.2% of subjects across groups and long-term seroprotection (antibody concentrations ≥1.0 IU/mL) was reached by all subjects for anti-D and for anti-T antibody by between 97.8-100% of subjects.
- *Anti-PRP immune response:* Short-term seroprotection (≥ 0.15 μg/mL): Between 98.5-100% of subjects across groups and long-term seroprotection (≥ 1.0 μg/mL) for between 97.7-99.3% of subjects across groups.

8. SAFETY RESULTS

8.1. Primary Total vaccinated cohort analysis

8.1.1. Primary vaccination doses received

All enrolled subjects received at least one dose of study vaccine (Table 35):

- For the Hexa group, the correct number of doses of *Infanrix hexa*, *Prevnar13* and *Rotarix* were received by 93.8%, 93.8% and 95.4%, respectively.
- For the Pedia group, the correct number of doses of *ActHIB*, *Pediarix*, *Prevnar13* and *Rotarix* were received by 95.4%, 95.4%, 95.4% and 96.9%, respectively.
- For the Penta group, the correct number of doses of *Engerix-B, Pentacel*, *Prevnar13* and *Rotarix* were received by 91.8%, 91.8%, 91.8%, and 96.4%, respectively.

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
N = number of subjects in each group included in the considered cohort
n/% = number/percentage of subjects receiving the specified total number of doses
Any = number and percentage of subjects receiving at least one dose

8.1.2. Symptom eCRF screen compliance

Compliance in recording general symptom eCRF screens or local symptom eCRF screens was typically very high across groups for each of the three scheduled doses i.e. total results per group were at least 95% and results per treatment group across doses were at least 94% (Table 36).

Table 36 Compliance in returning symptom sheets for priming doses (Primary Total vaccinated cohort)

Dose	Group	Number of doses	Doses NOT according to protocol	Number of general SS	Compliance % general SS	Number of local SS	Compliance % local SS
1	Hexa group	195	1	185	94.9	185	94.9
	Pedia group	194	0	189	97.4	189	97.4

	Pedia group	567	0	548	96.6	548	96.6
	Penta group	565	1	537	95.0	539	95.4

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
SS = Symptom screens/sheets used for the collection of local and general solicited AEs
Compliance % = (number of doses with symptom screen/sheet return / number of administered doses) X 100

8.1.3. Overall incidence of adverse events

Please refer to the following Tables:

1. Incidence and nature of symptoms (solicited and unsolicited): Table 37;
   - In all three groups (Hexa, Pedia and Penta) over the primary doses, symptoms (solicited and/or unsolicited, local and/or general) were reported for 93.4-96.4% of subjects.
2. Incidence and nature of grade 3 symptoms (solicited and unsolicited): Table 38;
   - In all three groups (Hexa, Pedia and Penta) over the primary doses, grade 3 symptoms (solicited and/or unsolicited, local and/or general) were reported for 17.4-37.1% of subjects.
3. Incidence of local symptoms (solicited and unsolicited) reported for *Infanrix hexa*, *Pediarix*, *ActHIB*, *Pentacel* and *Engerix-B* vaccines: Table 39;
   - Overall local symptoms (solicited and unsolicited) over the primary doses, were recorded for subjects receiving: Infanrix hexa (76.4%); Pediarix (82.0%), ActHIB (84.5%), Pentacel (79.6%), and *Engerix-B* (74.0%).
4. Incidence of grade 3 local symptoms (solicited and unsolicited) reported for *Infanrix hexa*, *Pediarix*, *ActHIB*, *Pentacel* and *Engerix-B* vaccines: Table 40;
   - Overall grade 3 local symptoms (solicited and unsolicited) over the primary doses, were recorded for subjects receiving: Infanrix hexa (8.2%); Pediarix (18.6%), ActHIB (19.6%), Pentacel (17.3%), and *Engerix-B* (9.7%).

Please also refer to the following Tables:

1. Incidence and nature of symptoms (solicited and unsolicited) that were causally related to vaccination reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall: Table 8.1.
2. Incidence and nature of grade 3 symptoms (solicited and unsolicited) that were causally related to vaccination reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall: Table 8.2.
3. Incidence and nature of symptoms (solicited and unsolicited) reported during the 31-day (Days 0-30) post-vaccination period following each priming dose and overall: Table 8.3.
4. Incidence and nature of grade 3 symptoms (solicited and unsolicited) reported during the 31-day (Days 0-30) post-vaccination period following each priming dose and overall: Table 8.4.
5. Incidence and nature of symptoms (solicited and unsolicited) that were causally related to vaccination reported during the 31-day (Days 0-30) post-vaccination period following each priming dose and overall: Table 8.5.
6. Incidence and nature of grade 3 symptoms (solicited and unsolicited) that were causally related to vaccination reported during the 31-day (Days 0-30) post-vaccination period following each priming dose and overall: Table 8.6.

Table 37 Incidence and nature of symptoms (solicited and unsolicited) reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines

Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines

Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine

For each dose and overall/subject:

N = number of subjects with at least one administered dose

n/% = number/percentage of subjects presenting at least one type of symptom whatever the study vaccine administered

For overall/dose:

N = number of administered doses

n/% = number/percentage of doses followed by at least one type of symptom whatever the study vaccine administered

95% CI = exact 95% confidence interval, LL = Lower Limit, UL = Upper Limit

Table 39 Incidence of local symptoms (solicited and unsolicited) reported for *Infanrix hexa*, *Pediarix*, *ActHIB*, *Pentacel* and *Engerix-B* vaccines during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall (Primary Total vaccinated cohort)

8.1.4. Solicited local adverse events

Incidence of solicited local symptoms is summarized in Table 41.

Pain was the most frequently reported solicited local symptom reported in 67.9% of subjects in the Hexa group, in 82.0% of subjects in the Pedia group and in 79.8% of subjects in the Penta group.

Pain was also the most frequently reported Grade 3 solicited local symptom reported in 4.3% of subjects in the Hexa group, 18.0% of subjects in the Pedia group and 11.7% of subjects in the Penta group.

Medical advice was sought for not more than 1.1% of subjects following any one local symptom.

Please also refer to the following Tables:

1. Incidence of local symptoms (solicited and unsolicited) that were causally related to vaccination reported for *Infanrix hexa*, *Pediarix*, *ActHIB*, *Pentacel* and *Engerix-B* vaccines during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall: Table 8.7.
2. Incidence of grade 3 local symptoms (solicited and unsolicited) that were causally related to vaccination reported for *Infanrix hexa*, *Pediarix*, *ActHIB*, *Pentacel* and *Engerix-B* vaccines during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall: Table 8.8.

The incidence of solicited local symptoms reported during the 4-day (Days 0-3) post-vaccination period for the Primary Total Vaccinated Cohort by gender and by geographical ancestry is presented in Table 8.9 and Table 8.10, respectively.

Table 41 Incidence of solicited local symptoms reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
For each dose and overall/subject:
N = number of subjects with at least one documented dose
n/% = number/percentage of subjects reporting the symptom at least once
For Overall/dose:
N = number of documented doses
n/% = number/percentage of doses followed by at least one type of symptom
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit

8.1.5. Solicited general adverse events

Incidence of solicited general symptoms are summarised in Table 42.

- Irritability / Fussiness was the most frequently reported solicited general symptom in all the groups, reported in 87.7% of subjects in the Hexa group, in 96.3% of subjects in the Pedia group and in 94.1% of subjects in the Penta group overall.
- Irritability was also the most commonly reported solicited general symptom graded 3 in intensity; reported for 9.6% of subjects in the Hexa group, 18.5% of subjects in the Pedia group and 16.0% of subjects in the Penta group overall.
- Grade 3 fever (>40.0°C rectal temperature) was reported for 0.0% of subjects in the Hexa and Penta groups, and 1.1% of subjects (2 subjects) in the Pedia group.
- Medical advice was sought in ≤ 1.6% of subjects following any one general symptom.
- The majority of solicited general symptoms following vaccination were considered by the investigator to be causally related to vaccination in the three groups.

The incidence of solicited general symptoms reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall for the Primary Total vaccinated cohort according to gender and geographical ancestry is presented in Table 8.11 and Table 8.12, respectively.

Table 42 Incidence of solicited general symptoms reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
For each dose and overall/subject:
N = number of subjects with at least one documented dose
n/% = number/percentage of subjects reporting the symptom at least once
For Overall/dose:
N = number of documented doses
n/% = number/percentage of doses followed by at least one type of symptom
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit

8.1.6. Unsolicited adverse events

The percentage of subjects who recorded the occurrence of unsolicited symptoms and grade 3 unsolicited symptoms within the 31-day (Days 0-30) post-vaccination period for the Primary Total vaccinated cohort is presented in Table 43 and Table 44, respectively.

- At least one unsolicited symptom within the 31-day post-vaccination period after each vaccination, classified by MedDRA Primary System Organ Class and Preferred Term was reported for 57.9%, 55.7% and 49.0% of subjects in the Hexa, Pedia and Penta groups, respectively (Table 43). The corresponding unsolicited symptoms within the 31-day (Days 0-30) post vaccination period following priming doses is provided in Table 8.13.
- The most commonly reported unsolicited symptoms in the Hexa group was Upper Respiratory Tract Infection (URTI) (15.4%) followed by Cough (7.7%) and Pyrexia (6.2%). In the Pedia group, the most commonly reported symptom was URTI (11.9%) followed by Conjunctivitis, Gastrooesophageal reflux disease, Teething, and Vomiting (4.1%). The most commonly reported symptoms in the Penta group were URTI (13.3%) followed by Pyrexia (7.7%), Diarrhoea (5.1%) and Vomiting (5.1%).
- A grade 3 unsolicited symptom was reported for 6.7%, 6.2% and 3.6% of subjects in Hexa, Pedia and Penta groups, respectively (Table 44). The most commonly reported grade 3 unsolicited symptom in the Hexa group were URTI and Otitis media (1.5%) followed by Pyrexia and Vomiting (1.0%). In the Pedia group, grade 3 unsolicited symptoms reported in more than one subject were URTI, Conjunctivitis and Irritability (1.0%). In the Penta group, grade 3 unsolicited symptoms reported in more than one subject were URTI (1.0%). The corresponding grade 3 unsolicited symptoms within the 31-day (Days 0-30) post vaccination period following priming doses is provided in Table 8.14.
- The investigator assessed a causal relationship between at least one unsolicited symptom and primary vaccination for 12.3%, 14.4% and 17.3% of subjects in the Hexa, Pedia and Penta groups, respectively – Table 8.15.

The percentage of doses followed by an unsolicited symptom with causal relationship to vaccination, grade 3 unsolicited symptom with causal relationship to primary vaccination, and doses followed by a grade 3 unsolicited symptom with causal relationship to primary vaccination, within the 31-day (Days 0-30) post-vaccination period for the Primary Total vaccinated cohort are presented in Table 8.16, Table 8.17 and Table 8.18.

The following data are summarised in the following tables:

- The percentage of subjects who reported the occurrence of unsolicited symptoms by gender (Table 8.19), and of unsolicited symptoms by geographical ancestry (Table 8.20).
- The percentage of subjects who reported the occurrence of grade 3 unsolicited symptoms by gender (Table 8.21), and of grade 3 unsolicited symptoms by geographical ancestry (Table 8.22).
- The percentage of subjects who reported the occurrence of unsolicited symptoms with causal relationship to primary vaccination by gender (Table 8.23), and of unsolicited symptoms with causal relationship to primary vaccination by geographical ancestry (Table 8.24).
- The percentage of subjects who reported the occurrence of grade 3 unsolicited symptoms with causal relationship to primary vaccination by gender (Table 8.25), and of grade 3 unsolicited symptoms with causal relationship to primary vaccination by geographical ancestry (Table 8.26).
- The percentage of subjects who reported the occurrence of unsolicited symptoms following priming doses by gender (Table 8.27), and of unsolicited symptoms following priming doses by geographical ancestry (Table 8.28).
- The percentage of subjects who reported the occurrence of grade 3 unsolicited symptoms following priming doses by gender (Table 8.29), and of grade 3 unsolicited symptoms following priming doses by geographical ancestry (Table 8.30).
- The percentage of subjects who reported the occurrence of unsolicited symptoms with causal relationship to vaccination following priming doses by gender (Table 8.31), and of unsolicited symptoms with causal relationship to vaccination following priming doses by geographical ancestry (Table 8.32).
- The percentage of subjects who reported the occurrence of grade 3 unsolicited symptoms with causal relationship to vaccination following priming doses by gender (Table 8.33), and of grade 3 unsolicited symptoms with causal relationship to vaccination following priming doses by geographical ancestry (Table 8.34).

Table 43 Percentage of subjects reporting the occurrence of unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following priming doses (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with at least one administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 44 Percentage of subjects reporting the occurrence of grade 3 unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following priming doses (Primary Total vaccinated cohort)

At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with at least one administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

8.1.7. According-to-protocol cohort analysis

In the Hexa, Pedia and Penta groups less than 5% of subjects who received a vaccine dose were excluded from the Primary ATP cohort for safety: 0.5%, 0.5% and 2.6%, respectively (Table 18). Thus a complementary analysis was not carried out on the Primary ATP cohort for safety.

8.1.8. Serious adverse events

The SAE Summary Table(s) are in Section 12.1 (Table 8.46) and the SAE Clinical Narratives reports are in Section 12.2.

8.1.8.1. Fatal events

No fatal SAEs were reported during the course of the study.

8.1.8.2. Non-fatal events

Non-fatal SAEs from Dose 1 up to 6 months following priming doses were reported for 7 (3.6%) subjects in the Hexa group and Penta group, and 1 (0.5%) subject in the Pedia group (Table 45). Only two SAEs were reported by more than one subject in any group: 2 subjects (1.0%) with Respiratory distress in the Hexa group and 2 subjects with Parainfluenzae virus infection in the Penta group.

All subjects who experienced an SAE were considered recovered/ resolved at the end of the study except one non-causally related event of Choking in a 47-week-old female in the Hexa group which was considered recovered/ resolved with sequelae (Table 8.46).

Three SAEs occurring in two subjects were considered causally related to primary vaccination by the investigator:

- An SAE of Lethargy in an 8-week-old female subject in the Hexa group which recovered/resolved after one day.
- Two SAEs in the same subject: one “Apparent life-threatening event” and one event of Leukocytosis were observed in a 10-week-old female subject in the Hexa group which recovered/resolved over 1-2 days.

The percentage of subjects for whom the occurrence of SAEs was reported following priming doses by gender and geographical ancestry are presented in Table 8.44 and Table 8.45.

Table 45 Number (%) of subjects with serious adverse events (SAE) from Dose 1 up to 6 months following priming doses (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with at least one administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

8.1.9. Adverse events leading to premature discontinuation of study vaccine and/or study

Two subjects had adverse events leading to premature discontinuation of the study (Table 6.2):

- One Hexa group subject with an SAE of Lethargy reported after the first vaccination;
- One Penta group subject with a Non-Serious Adverse Event of Seizure reported after the Month 2 dose.

8.1.10. Other significant adverse events

8.1.10.1. New Onset of Chronic Illness (NOCI)

NOCI symptoms were reported for 7 subjects (3.6%) in the Hexa group, 11 subjects (5.7%) in the Pedia group and 10 subjects (5.1%) in the Penta group (Table 46).

- The two reported symptoms in the Hexa group were Dermatitis atopic (2.6%) followed by Bronchial hyperreactivity (1.0%). In the Pedia group, the symptom reported by more than one subject was Dermatitis atopic (3.6%). In the Penta group, the symptoms reported by more than one subject were Dermatitis atopic (3.6%) and Asthma (1.0%).

The percentage of subjects for whom the occurrence of NOCI classified by MedDRA Primary System Organ Class and Preferred Term was reported following priming doses by gender and geographical ancestry are presented in Table 8.41 and Table 8.42.

8.1.10.2. Hypotonic-Hyporesponsive Episode (HHE) and Convulsion

A search of the study data for symptoms which could be related to HHE within 31 days post-vaccination was conducted (broad MedDRA SMQ (Standardised MedDRA Queries) hypotonic-hyporesponsive episode) and 2 subjects with Cyanosis in the Penta group were identified (Table 8.35), who were both female (Table 8.37) and of the White Caucasian geographical ancestry (Table 8.38). After medical review of the cases, both of them were assessed as not meeting criteria for HHE.

A similar search this time for the narrow MedDRA SMQ “convulsion” with 31 days post-vaccination did not identify any subjects (Table 8.36, Table 8.39, Table 8.40).

8.1.11. Concomitant medications /vaccinations

The intake of any concomitant medication was reported for between 60.0-75.8% of subjects in all three groups (Hexa, Pedia and Penta) during the 4-day (Day 0-3) post-vaccination period (Table 47).

- Between 54.9-69.1% of subjects across groups received any antipyretic and between 12.8-13.9% of subjects across groups received a prophylactic antipyretic concomitant medication.

The corresponding concomitant medication results during the 31-day (Days 0-30) post-vaccination period following each priming dose and overall are provided in Table 8.43.

n/% = number/percentage of doses after which the specified concomitant medication was started at least once during the mentioned period
95% CI = exact 95% confidence interval, LL = Lower Limit, UL = Upper Limit

8.1.12. Clinical laboratory evaluations

Not applicable

8.1.13. Pregnancy

Not applicable

8.1.14. Important safety information received after the data lock point (database freeze date)

None

8.1.15. Primary Total vaccinated cohort - Safety summary

- *Any Symptom:* In all three groups (Hexa, Pedia and Penta) over the primary doses, symptoms (solicited and/or unsolicited, local and/or general) were reported for 93.4-96.4% of subjects.
- *Solicited local symptoms:* Pain was the most frequently reported solicited local symptom reported in 67.9% of subjects in the Hexa group, in 82.0% of subjects in the Pedia group and in 79.8% of subjects in the Penta group.

  Pain was also the most frequently reported Grade 3 solicited local symptom reported in 4.3% of subjects in the Hexa group, 18.0% of subjects in the Pedia group and 11.7% of subjects in the Penta group.
- *Solicited general symptoms:* Irritability / Fussiness was the most frequently reported solicited general symptom in all groups, reported in 87.7% of subjects in the Hexa group, in 96.3% of subjects in the Pedia group and in 94.1% of subjects in the Penta group overall.

  Irritability was also the most commonly reported grade 3 solicited general symptom, reported for 9.6% of subjects in the Hexa group, 18.5% of subjects in the Pedia group and 16.0% of subjects in the Penta group overall.
- *Unsolicited adverse events:* At least one unsolicited symptom within the 31-day post-vaccination period after each vaccination was reported for 57.9%, 55.7% and 49.0% of subjects in the Hexa, Pedia and Penta groups, respectively.

  The most commonly reported unsolicited symptom in the three groups was URTI: Hexa group:15.4%; Pedia group: 11.9%; Penta group: 13.3%.

Grade 3 unsolicited symptoms were reported for 6.7%, 6.2% and 3.6% of subjects in Hexa, Pedia and Penta groups, respectively. The most commonly reported grade 3 unsolicited symptoms were:
Hexa group: URTI and Otitis media (1.5%);
Pedia group: URTI, Conjunctivitis and Irritability (1.0%);
Penta group: URTI (1.0%).

- *Adverse events of interest:* NOCI symptoms were reported for 7 subjects (3.6%) in the Hexa group, 11 subjects (5.7%) in the Pedia group and 10 subjects (5.1%) in the Penta group. The two reported symptoms in the Hexa group were Dermatitis atopic (2.6%) followed by Bronchial hyperreactivity (1.0%). In the Pedia group, the symptom reported by more than one subject was Dermatitis atopic (3.6%). In the Penta group, the symptoms reported by more than one subject were Dermatitis atopic (3.6%) and Asthma (1.0%).
- *Serious adverse events:* Non-fatal SAEs from Dose 1 up to 6 months following priming doses were reported for 7 (3.6%) subjects in the Hexa group and Penta group, and 1 (0.5%) subject in the Pedia group. All SAE were considered recovered/resolved without sequelae at the end of the study except one non-causally related event of Choking in a 47-week-old female in the Hexa group which was considered recovered/resolved with sequelae.

  Three SAEs occurring in two subjects were considered causally related to primary vaccination by the investigator: An SAE of Lethargy in an 8-week-old female subject in the Hexa group which recovered/resolved after one day without sequelae; 2 SAEs in the same subject: one “Apparent life-threatening event” and one event of Leukocytosis were observed in a 10-week-old female subject in the Hexa group which recovered/resolved over 1-2 days without sequelae.
- No fatal SAEs were reported during the primary vaccination Epoch of the study.
- *Withdrawals due to AEs /SAEs:* Two subjects had adverse events leading to premature discontinuation during the primary vaccination period: one Hexa group subject with an SAE of Lethargy reported after the first vaccination; one Penta group subject with a Non-Serious Adverse Event of Seizure reported after the Month 2 dose.

8.2. Booster Total vaccinated cohort analysis

8.2.1. Booster vaccination doses received

All subjects in the Booster Total vaccinated cohort received the planned booster vaccine doses as shown in Table 48.

Table 48 Number and percentage of subjects who received the study vaccine dose by vaccine (Booster Total vaccinated cohort)

Hexa group HIBERIX N = 167		Hexa group INFANRIX N = 167		Pedia group ACTHIB N = 158		Pedia group INFANRIX N = 158		Penta group PENTACEL N = 161	
n	%	n	%	n	%	n	%	n	%
167	100	167	100	158	100	158	100	161	100

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
N = number of subjects in each group included in the considered cohort
n/% = number/percentage of subjects receiving the dose

8.2.2. Symptom eCRF screen compliance

Compliance in recording general symptom eCRF screens or local symptom eCRF screens was typically very high across groups: at least 91.6% and at least 92.2%, respectively (Table 49).

Table 49 Compliance in returning symptom sheets for the booster dose (Booster Total vaccinated cohort)

Group	Number of doses	Doses NOT according to protocol	Number of general SS	Compliance % general SS	Number of local SS	Compliance % local SS
Hexa group	167	0	153	91.6	154	92.2
Pedia group	158	0	150	94.9	151	95.6
Penta group	161	0	151	93.8	150	93.2

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
SS = Symptom screens/sheets used for the collection of local and general solicited AEs
Compliance % = (number of doses with symptom screen/sheet return / number of administered doses) X 100

8.2.3. Overall incidence of adverse events

At least one solicited or unsolicited symptom was reported during the Booster phase for 77.2% of Hexa group subjects, 81.6% of Pedia group subjects and 70.2% of Penta group subjects (Table 50). General symptoms were reported by between 62.7-69.6% of subjects across groups and local symptoms were reported by between 47.2-63.3% of subjects across groups.

1. Incidence of local symptoms (solicited and unsolicited) reported for *Infanrix*, *Hiberix*, *ActHIB*, and *Pentacel* vaccines: Table 51;

   – Overall local symptoms (solicited and unsolicited) were recorded for subjects receiving: *Infanrix* (52.7% for Hexa group and 60.1% for Pedia group); *Hiberix* (47.9% for Hexa group), *ActHIB* (52.5% for Pedia group) and *Pentacel* (47.2% for Penta group).

2. Incidence and nature of grade 3 symptoms (solicited and unsolicited): Table 52;

   – In all three groups (Hexa, Pedia and Penta) grade 3 symptoms (solicited and/or unsolicited, local and/or general) were reported for 6.2-10.8% of subjects.

3. Incidence of grade 3 local symptoms (solicited and unsolicited) reported for *Infanrix*, *Hiberix*, *ActHIB*, and *Pentacel* vaccines: Table 53;

   – Overall local symptoms (solicited and unsolicited) were recorded for subjects receiving: *Infanrix* (6.0% for Hexa group and 7.0% for Pedia group); *Hiberix* (0.6% for Hexa group), *ActHIB* (3.2% for Pedia group) and *Pentacel* (3.7% for Penta group).

Please also refer to the following Tables:

1. Incidence and nature of grade 3 symptoms (solicited and unsolicited) that were causally related to Booster vaccination: Table 8.49.
2. Incidence and nature of symptoms (solicited and unsolicited) reported during the 31-day (Days 0-30) post-vaccination period following the booster dose: Table 8.50.
3. Incidence and nature of grade 3 symptoms (solicited and unsolicited) reported during the 31-day (Days 0-30) post-vaccination period following the booster dose: Table 8.51.
4. Incidence and nature of symptoms (solicited and unsolicited) that were causally related to vaccination reported during the 31-day (Days 0-30) post-vaccination period following the booster dose: Table 8.52.
5. Incidence and nature of grade 3 symptoms (solicited and unsolicited) that were causally related to vaccination reported during the 31-day (Days 0-30) post-vaccination period following the booster dose: Table 8.53.
6. Incidence of local symptoms (solicited and unsolicited) that were causally related to vaccination reported for *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel* vaccines during the 4-day (Days 0-3) post-vaccination period following the booster dose: Table 8.54.
7. Incidence of grade 3 local symptoms (solicited and unsolicited) that were causally related to vaccination reported for *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel* vaccines during the 4-day (Days 0-3) post-vaccination period following the booster dose: Table 8.55.

Table 50 Incidence and nature of symptoms (solicited and unsolicited) reported during the 4-day (Days 0-3) post-vaccination period following the booster dose (Booster Total vaccinated cohort)

	Any symptom					General symptoms					Local symptoms

8.2.4. Solicited local adverse events

Incidence of solicited local symptoms are summarized in Table 54.

Pain was the most frequently reported solicited local symptom reported in 46.8% of subjects in the Hexa group, in 51.0% of subjects in the Pedia group and in 39.3% of subjects in the Penta group.

Redness was the most frequently reported Grade 3 (>20; Section 5.9.2.1) solicited local symptom reported in 5.2% of subjects in the Hexa group, 4.0% of subjects in the Pedia group and 1.3% of subjects in the Penta group.

Medical advice was sought for not more than 1.3% of subjects following any one symptom.

Please also refer to the following Tables:

1. Incidence of local symptoms (solicited and unsolicited) that were causally related to vaccination reported for *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel* vaccines during the 4-day (Days 0-3) post-vaccination period following the booster dose: Table 8.54.
2. Incidence of grade 3 local symptoms (solicited and unsolicited) that were causally related to vaccination reported for *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel* vaccines during the 4-day (Days 0-3) post-vaccination period following the booster dose: Table 8.55.

The incidence of solicited local symptoms reported during the 4-day (Days 0-3) post-vaccination period following the booster dose by gender and by geographical ancestry are presented in Table 8.56 and Table 8.57, respectively.

The incidence of large injection site reaction reported during the 4-day (Days 0-3) post-vaccination period following the booster dose is presented in Table 8.58. A total of two subjects (1.3%) in the Hexa group and one subject (0.7%) in the Pedia group had Local Swelling, and Diffuse Swelling was recorded in one subject (0.6%) in the Hexa group. See Section 5.9.2.1 and Section 5.10.5.3 for the definition of large injection site reactions defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of limb circumference, with details of how these events were recorded.

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
N = number of subjects with the documented dose
n/% = number/percentage of subjects reporting the symptom at least once
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit

8.2.5. Solicited general adverse events

Incidence of solicited general symptoms are summarised in Table 55.

- Irritability / Fussiness was the most frequently reported solicited general symptom in all the groups, reported in 56.2% of subjects in the Hexa group, in 62.7% of subjects in the Pedia group and in 50.3% of subjects in the Penta group.
- Irritability / Fussiness was also the most commonly reported solicited general symptom graded 3 in intensity; reported for 2.0% of subjects in the Hexa group, 2.7% of subjects in the Pedia group and 2.6% of subjects in the Penta group.
- Grade 3 fever (>40.0°C rectal temperature) was reported for none of the subjects in any group.
- Medical advice was sought by only 2 subjects in the Pedia group and 2 subjects in the Penta group.
- The majority of solicited general symptoms following vaccination were considered by the investigator to be causally related to vaccination in the three groups.

The incidence of solicited general symptoms reported during the 4-day (Days 0-3) post-vaccination period following the booster dose by gender and geographical ancestry are presented in Table 8.59 and Table 8.60, respectively.

Table 55 Incidence of solicited general symptoms reported during the 4-day (Days 0-3) post-vaccination period following the booster dose (Booster Total vaccinated cohort)

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
N = number of subjects with the documented dose
n/% = number/percentage of subjects reporting the symptom at least once
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit

8.2.6. Unsolicited adverse events

The percentage of subjects for whom the occurrence of unsolicited symptoms and grade 3 unsolicited symptoms within the 31-day (Days 0-30) post-vaccination period for the Primary Total vaccinated cohort is presented in Table 56 and Table 57, respectively.

- At least one unsolicited symptom within the 31-day post-vaccination period after the booster vaccination, classified by MedDRA Primary System Organ Class and Preferred Term was reported for 22.2%, 22.2% and 25.5% of subjects in the Hexa, Pedia and Penta groups, respectively (Table 56).
- The most commonly reported unsolicited symptoms in the Hexa group was Pyrexia (3.0%) followed by Teething (2.4%) and Vomiting (2.4%). In the Pedia group, the most commonly reported symptoms were Pyrexia (3.2%), Otitis Media (3.2%) and URTI (3.2%). The most commonly reported symptoms in the Penta group were URTI (5.0%) followed by Viral Infection (3.1%), Otitis Media (1.9%), Diarrhoea (1.9%) and Teething (1.9%).
- A grade 3 unsolicited symptom was reported for 3.0%, 1.9% and 1.9% of subjects in Hexa, Pedia and Penta groups, respectively (Table 57). No grade 3 unsolicited symptom was reported by more than one subject in any group.
- The investigator assessed a causal relationship between at least one unsolicited symptom and booster vaccination for 1.8%, 1.9% and 1.9% of subjects in the Hexa, Pedia and Penta groups, respectively – Table 8.61. None of these unsolicited symptoms were reported by more than one subject in any group.

No subject reported a grade 3 unsolicited symptom with causal relationship to booster vaccination (Table 8.62).

The following data are summarised in the following tables:

- The percentage of subjects who reported the occurrence of unsolicited symptoms by gender (Table 8.63), and of unsolicited symptoms by geographical ancestry (Table 8.64).
- The percentage of subjects who reported the occurrence of grade 3 unsolicited symptoms by gender (Table 8.65), and of grade 3 unsolicited symptoms by geographical ancestry (Table 8.66).
- The percentage of subjects who reported the occurrence of unsolicited symptoms with causal relationship to booster vaccination by gender (Table 8.67), and of unsolicited symptoms with causal relationship to booster vaccination by geographical ancestry (Table 8.68).
- No subjects reported the occurrence of grade 3 unsolicited symptoms with causal relationship to booster vaccination by gender (Table 8.69), or of grade 3 unsolicited symptoms with causal relationship to primary vaccination by geographical ancestry (Table 8.70).

Table 56 Percentage of subjects reporting the occurrence of unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following the booster dose (Booster Total vaccinated cohort)

Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with the administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

8.2.7. According-to-protocol cohort analysis

In the Hexa, Pedia and Penta groups less than 5% of subjects who received a vaccine dose were excluded from the Primary ATP cohort for safety: 0.0%, 0.0% and 0.6%, respectively (Table 19). Thus a complementary analysis was not carried out on the Booster ATP cohort for safety.

8.2.8. Serious adverse events

The SAE Summary Table(s) are in Section 12.1 (Table 8.80) and the SAE Clinical Narratives reports are in Section 12.2.

8.2.8.1. Fatal events

No fatal SAEs were reported during the course of the study.

8.2.8.2. Non-fatal events

Non-fatal SAEs within 31 days post-booster were recorded for one (0.6%) subject in the Hexa group (Petechiae), for one (0.6%) subject in the Penta group (Seizure like phenomena), and no subject in the Pedia group during the booster vaccination epoch of the study (Table 58 and Table 8.46). None of the two non-fatal SAEs were considered to be causally-related to vaccination and both were recorded to have an outcome of "recovered/resolved" (Table 8.46).

The percentage of subjects for whom the occurrence of SAEs was reported following the booster dose by gender is presented in Table 8.80.

8.2.8.3. SAEs for the full study

There were no fatal SAEs throughout the study. Non-fatal SAEs were reported for 8 subjects in the Hexa group and Penta group, and one subject in the Pedia group throughout the study (Table 45 and Table 58). Only two SAEs were reported by more than one subject in a group during the primary epoch: 2 subjects (1.0%) with Respiratory distress in the Hexa group and 2 subjects with Parainfluenzae virus infection in the Penta group (Table 45). See Section 8.1.8.2 for details of non-fatal SAEs which were not considered fully recovered/resolved and were causally-related to primary vaccination in the primary Epoch.

95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

8.2.9. Adverse events leading to premature discontinuation of study vaccine and/or study

None

8.2.10. Other significant adverse events

8.2.10.1. New Onset of Chronic Illness (NOCI)

NOCI symptoms were reported for 4 subjects (2.4%) in the Hexa group, 1 subject (0.6%) in the Pedia group and 1 subject (0.6%) in the Penta group (Table 8.77). Only Seasonal allergy symptoms were reported by more than one subject in any group: 3 (1.8%) subjects.

The percentage of subjects for whom the occurrence of NOCI classified by MedDRA Primary System Organ Class and Preferred Term was reported following booster dose by gender and geographical ancestry are presented in Table 8.78 and Table 8.79.

8.2.10.2. Hypotonic-Hyporesponsive Episode and Convulsion

A search of the study data for symptoms reported within 31 days post-vaccination which could be related to HHE was conducted (broad MedDRA SMQ hypotonic-hyporesponsive episode) and no subjects were identified (Table 8.71, Table 8.73, Table 8.75).

A search of the study data for symptoms reported within 31 days post-vaccination which could be related to "convulsion" was conducted (narrow MedDRA SMQ 'convulsion') and 1 subject that developed seizure like phenomena in the Penta group was identified (Table 8.72), who was female (Table 8.74) and of the "Other" geographical ancestry (Table 8.76). The case narrative suggested that the subject was suspected of having frontal lobe epilepsy and up to the end of follow-up was undergoing treatment with Levetiracetam.

8.2.11. Concomitant medications /vaccinations

The intake of any concomitant medication was reported for between 23.4-28.5% of subjects in all three groups (Hexa, Pedia and Penta) during the 4-day (Day 0-3) post-booster vaccination period (Table 59).

Between 21.1-27.2% of subjects across groups received any antipyretic and between 3.8-7.2% of subjects across groups received a prophylactic antipyretic concomitant medication.

Table 59 Number and percentage of subjects starting a concomitant medication during the 4-day (Days 0-3) post-vaccination period (Booster Total vaccinated cohort)

	Hexa group					Pedia group					Penta group

Hexa group = Subjects who received primary doses of *Infanrix hexa* and a booster dose of *Infanrix* and *Hiberix* vaccines
Pedia group = Subjects who received primary doses of *Pediarix* and *ActHIB* and a booster dose of *Infanrix* and *ActHIB* vaccines
Penta group = Subjects who received primary doses of *Pentacel* and *Engerix-B* and a booster dose of *Pentacel* vaccine
N = number of subjects with the administered dose
n/% = number/percentage of subjects who started to take the specified concomitant medication at least once during the mentioned period
95% CI = exact 95% confidence interval, LL = Lower Limit, UL = Upper Limit

8.2.12. Clinical laboratory evaluations

Not applicable

8.2.13. Pregnancy

Not applicable

8.2.14. Important safety information received after the data lock point (database freeze date)

None

8.2.15. Booster Total vaccinated cohort - Safety summary

- *Any Symptom:* At least one solicited or unsolicited symptom was reported during the Booster phase for 77.2% of Hexa group subjects, 81.6% of Pedia group subjects and 70.2% of Penta group subjects.
- *Solicited local symptoms:* Pain was the most frequently reported solicited local symptom reported in 46.8% of subjects in the Hexa group, 51.0% of Pedia group subjects and 39.3% of Penta group subjects.

  Redness was the most frequently reported Grade 3 solicited local symptom reported in 1.3-5.2% of subjects in the three groups.
- *Solicited general symptoms:* Irritability / Fussiness was the most frequently reported solicited general symptom in all the groups, reported in 56.2% of Hexa group subjects, in 62.7% of Pedia group subjects and in 50.3% of Penta group subjects.

  Irritability / Fussiness was also the most commonly reported grade 3 solicited general symptom, reported for between 2.0 and 2.7% of subjects across groups.
- *Unsolicited adverse events:* At least one unsolicited symptom within the 31-day post-vaccination period after the booster vaccination was recorded for 22.2%, 22.2% and 25.5% of subjects in the Hexa, Pedia and Penta groups, respectively.

  The most commonly reported unsolicited symptoms were:
  Hexa group: Pyrexia (3.0%); Pedia group: Pyrexia, Otitis media and URTI (3.2%); Penta group: URTI (5.0%).

  A grade 3 unsolicited symptom was reported for 3.0%, 1.9% and 1.9% of subjects in Hexa, Pedia and Penta groups, respectively. No grade 3 unsolicited symptom was reported by more than one subject in any group.
- *Adverse events of interest:* NOCI were reported for 4 subjects (2.4%) in the Hexa group, 1 subject (0.6%) in the Pedia group and 1 subject (0.6%) in the Penta group. Only Seasonal allergy symptoms were reported by more than one subject in any group: 3 (1.8%) subjects.
- *Large injection site reactions up to 4 days (D0-D3) after vaccination:* Two subjects (1.3%) in the Hexa group and one subject (0.7%) in the Pedia group had Local Swelling, and Diffuse Swelling was recorded in one subject (0.6%) in the Hexa group.

- *Serious adverse events within 31 days post booster:* Non-fatal SAEs within 31 days post-booster dose were reported for one (0.6%) subject in the Hexa group (Petechiae), for one (0.6%) subject in the Penta group (Seizure like phenomena), and no subject in the Pedia group. None of the two non-fatal SAEs were considered to be causally-related to vaccination and both were recorded to have an outcome of "recovered/resolved".
- *Withdrawals due to AEs /SAEs:* No subject was withdrawn due to an AE or SAE during the booster Epoch.
- ***SAEs for the full study:*** There were no fatal SAEs throughout the study. SAEs were reported for 8 subjects in the Hexa group and Penta group, and for one subject in the Pedia group throughout the study

9. OVERALL CONCLUSIONS

- The primary objective of the study was met: One month post-primary vaccination, *Infanrix hexa* was demonstrated to be non-inferior to *Pediarix+ACTHib* in terms of antibody GMCs for the three pertussis antigens (PT, FHA, and PRN).
- *One month after the primary vaccination:* The immune responses to *Infanrix hexa*, *Pediarix+ACTHib* and *Pentacel*/*Engerix-B* were similar between the different groups, in terms of seroprotection/seropositivity rates and GMCs.

  The lowest anti-PRP GMCs were observed after *Infanrix hexa* vaccination as compared to *Pediarix+ACTHib* and *Pentacel+Engerix-B*.
- *One month after the booster vaccination:* The immune responses to *Infanrix+Hiberix* (booster vaccines used after *Infanrix hexa* priming), *Infanrix+ActHIB* (booster vaccines used after *Pediarix+ActHIB* priming) and *Pentacel* were similar between the different groups, in terms of seroprotection/seropositivity rates and GMCs.

  Similar Anti-PRP long-term protection antibody levels were observed (≥1.0 µg/mL) between *Infanrix+Hiberix*, *Infanrix+ActHIB* and *Pentacel* after booster vaccination.
- *Safety, reactogenicity:* Clinically acceptable safety and reactogenicity profile in the different vaccination groups, aligned with the very well-known profiles of the study vaccines.

Case ID: PPD

Serious Events: PPD Respiratory distress, Hyponatraemia

Non Serious Events:

Suspect Product Name With Formulation, Dose, Units and Frequency**:** [DTPa-HBV-IPV+Hib vaccine]:[Solution for injection] <Blank> <Blank> <Blank>;[Prevnar 13]:[Solution for injection] <Blank> <Blank> <Blank>;[Rotavirus vaccine lyophilized formulation]:[Oral drops] <Blank> <Blank> <Blank>

Narrative: This 15-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 3rd dose of Infanrix hexa (intramuscular) on 15th October 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13 (intramuscular) on 15th October 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 15th August 2014, for prophylaxis.

On PPD 277 days after receiving Infanrix hexa and Prevnar 13 and 338 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed moderate - grade 2 respiratory distress. Serious criteria included hospitalization, GSK medically significant and life threatening. Additional event(s) included moderate - grade 2 hyponatremia on 19th July 2015 with serious criteria of hospitalization and life threatening and moderate - grade 2 PPD on 19th July 2015 19:30 with serious criteria of hospitalization, GSK medically significant and life threatening. The subject was treated with oxygen. The outcome of respiratory distress was recovered/resolved on 20th July 2015. The outcome(s) of the additional event(s) included hyponatremia (recovered/resolved on 20th July 2015) and PPD (recovered/resolved on 20th July 2015 14:30).

The investigator considered that there was no reasonable possibility that the respiratory distress, hyponatremia and PPD may have been caused by Infanrix hexa, Prevnar 13 and Rotavirus vaccine lyophilized formulation.

Relevant Tests: Chest X-Ray 07/19/2015: "CXR looks pretty clear but does have mild metabolic acidosis...."

Diagnostic results (unless otherwise stated, normal values were not provided): On 19th July 2015, Alanine aminotransferase result was 36 IU/L (normal low: 10, normal high: 35), Base excess result was -7 mmol/L (normal low: -2.5, normal high: 2.5), Blood bicarbonate result was 19 mmol/L (normal low: 22, normal high: 28), Blood creatine result was 0.25 mg/dL (normal low: 0.4, normal high: 0.7), Blood creatine result was less than 0.2 mg/dL (normal low: 0.4, normal high: 0.7), Blood glucose result was 112 mg/dL (normal low: 65, normal high: 99), Blood glucose result was 104 mg/dL (normal low: 65, normal high: 99),

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

Blood sodium result was 133 mmol/L (normal low: 135, normal high: 145), Blood sodium result was 134 mmol/L (normal low: 135, normal high: 145), Mean platelet volume result was 8.2 fL (normal low: 9, normal high: 12), Oxygen saturation result was 93 % (normal low: 60, normal high: 80), PCO2 result was 34 mmHg (normal low: 41, normal high: 51), PO2 result was 68 mmHg (normal low: 30, normal high: 45) and Red cell distribution width result was 34.3 fL (normal low: 38, normal high: 49). On 20th July 2015, Blood creatine result was 0.23 mg/dL (normal low: 0.4, normal high: 0.7), Blood glucose result was 80 mg/dL (normal low: 65, normal high: 99) and Blood sodium result was 140 mmol/L (normal low: 135, normal high: 145).

Investigator's text:
20JUL2015 subject's mother contacted the office. Mother stated that the subject suffered a PPD episode on 19JUL2015. The subject was PPD Subject was taken to the hospital. Subject was just discharged.
21JUL2015 Study Coordinator contacted parent for more information. Parent states that the episode took place 19JUL2015 at approximately 19:30. Subject was PPD was unconscious and required CPR. Subject was given oxygen and taken by helicopter to the hospital. At the hospital, mother states that subject had an initial blood test and a second blood test prior to discharge. Subject also had a chest X-ray and parent was told by the doctor and a nurse that there was a small amount of water in the lung/s. No medications were given, per mother. Subject was hospitalized for observation and discharged the next day on 20JUL2015. At the time of this conversation, mother states that subject is doing well. She will be seen in clinic on Friday 24JUL2015.
28JUL2015-Additional information: When subject suffered the PPD episode and arrived at the hospital, mild respiratory distress was present. Oxygen was already being administered. Hospital blood lab test indicated mild hyponatremia, which resolved by the next day13AUG2015 Update: Blood laboratory results on the initial arrival to hospital on 19JUL2015 also showed the following; high levels of BUN/Creatinine Ratio, ALT, PO2 VBG, O2 Sat VBG. Low levels of RDW-SD, MPV, Creatinine, PCO2 VBG, HCO3 (Bicarb) VBG, Base Excess VBG. Per hospital report, chemistry was considered normal limits except for the expected low TCO2 due to acidosis and the hyperglycemia which was a stress reaction. The glucose and sodium levels returned to normal limits by the following day of 20JUL201519AUG2015-Information from paper SAE report: Discharge notification states: "PPD No apparent Neuro deficits. Initial mild respiratory distress resolved quickly."
PPD 31.07.2015: No reasonable possibility of a causal association with Rotarix, 338 days after vaccination. No reasonable possibility to be related to Infanrix Hexa vaccination

Serious Events: Parainfluenzae virus infection

Non Serious Events:

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

Suspect Product Name With Formulation, Dose, Units and Frequency: [Pentacel]:[Solution for injection] <Blank> <Blank> <Blank>;[Hepatitis B vaccine]:[Solution for injection] <Blank> <Blank> <Blank>;[Rotavirus vaccine lyophilized formulation]:[Oral drops] <Blank> <Blank> <Blank>;[Prevnar 13]:[Solution for injection] <Blank> <Blank> <Blank>

Narrative: This 5-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 2nd dose of Pentacel (intramuscular) on 3rd September 2014, for prophylaxis. The subject received the 1st dose of Hepatitis B vaccine (intramuscular) 10 µg on 30th June 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 3rd September 2014, for prophylaxis. The subject received the 2nd dose of Prevnar 13 (intramuscular) on 3rd September 2014, for prophylaxis.

On PPD 14:55, 5 days after receiving Pentacel, Rotavirus vaccine lyophilized formulation and Prevnar 13 and 70 days after receiving Hepatitis B vaccine, the subject developed moderate - grade 2 parainfluenzae virus infection. Serious criteria included hospitalization and GSK medically significant. The subject was treated with azithromycin. The outcome of parainfluenzae virus infection was recovered/resolved on 10th October 2014.

The investigator considered that there was no reasonable possibility that the parainfluenzae virus infection may have been caused by Pentacel, Hepatitis B vaccine, Rotavirus vaccine lyophilized formulation and Prevnar 13.

Relevant Tests: Respiratory Panel PCR positive for Parainfluenza. Rotavirus and bordetella pertussis testing negative. Workup in the ED include stool culture, urine culture, CBC and blood culture. CBC was reassuring, UA was normal, and cultures all returned negative Diagnostic results (unless otherwise stated, normal values were not provided): On 3rd October 2014, Blood calcium result was 10.6 mg/dL (normal low: 8.6, normal high: 10.5) and Blood urea result was 2 mg/dL (normal low: 5, normal high: 20).

Investigator comments:

Subject is a 5 month old female brought in to the ED today due to chronic diarrhea and dehydration. Per review of EMR, when baby was 4 month of age (Sep 3rd), child presented to our clinic for well child care. Mother reported concern of decreased po intake (breastfeeding per notes), thus mother started supplementing with formula. At that visit subject was immunized (including rotavirus) and was diagnosed with nasal congestion, but otherwise normal well child exam. One week later (Sep 10) she presented to primary care provider with complaint of vomiting and diarrhea x 2 days (onset sep 8), with report of 12 loose stools w/o blood in a 24 hr period and 6 episodes of non bloody emesis and temp to 103. Of note there are ill contacts with grandmother and sibling having cough and runny nose.
Child appeared well and playful on physical exam was sent home with diagnosis of acute gastroenteritis with reassurance and instructions to come back if fever persisted or if there were signs of dehydration. Subject remained ill, mother called PCC Sep 12 due to persistent symptoms, they direct them to the ED. In the ED parents report vomiting has resolved, but diarrhea persists consisting of 2 stools per hr, stools are mucosy and runny, and some upper respiratory symptoms including sneezing and mild cough. Her sibling also has URI. Workup in the ED include stool culture, urine culture, CBC and blood culture. CBC was reassuring, UA was normal, and cultures all returned negative, she was sent home with diagnosis of viral illness.

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

On sep 23 she returns to primary care provider with what is reported in EMR as new onset cough , rhinorrhea and fever x 3 days (however mother has reported to us in phone calls diarrhea and fever have persisted since onset September 8th). Today subject presents again to ED due to vomiting and diarrhea again, and admitted due to chronic diarrhea, concerns for pertussis and dehydration. More extensive testing is ordered today, O and P, rotavirus, viral culture, BMP and pertussis PCR and cultures. Child is being admitted on 10/3/14, was started on azythromycin and admitted for further observation.
Subject tested negative for bordetella pertussis and also rotavirus. Subject tested positive for parainfluenza. During hospitalization patient was stable on room air with stable vital signs. Patient did continue to have loose stool while in hospital but prior to discharge seemed to be decreasing in frequency/amount. At time of discharge on 10/5/2014 patient appeared well hydrated, stable vitals, on room air with improved feeding. Subject was instructed to continue Azithromycin course for 2 more days following discharge and follow up with PCP. Originally it was determined that the SAE was possibly related to the Investigational Product. Now that more tests have been run, a diagnosis of parainfluenza was made and more data gathered it has been decided by the PI that this SAE is not related the IP.

Narrative: This 11-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 2nd dose of Hepatitis B vaccine (intramuscular) 10 µg on 26th September 2014, for prophylaxis. The subject received the 3rd dose of Pentacel (intramuscular) on 26th September 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 8th July 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13 (intramuscular) on 26th September 2014, for prophylaxis.

On PPD 140 days after receiving Hepatitis B vaccine, Pentacel and Prevnar 13 and 220 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed mild - grade 1 respiratory syncytial virus bronchiolitis. Serious criteria included hospitalization and GSK medically significant. The subject was treated with prednisolone, salbutamol sulfate (Albuterol Sulfate), oxygen, amoxicillin and salbutamol (Albuterol). Pentacel was continued with no change. Prevnar 13 was continued with no change. The outcome of respiratory syncytial virus bronchiolitis was recovered/resolved on 23rd

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

February 2015.

The investigator considered that there was no reasonable possibility that the respiratory syncytial virus bronchiolitis may have been caused by Hepatitis B vaccine, Pentacel, Rotavirus vaccine lyophilized formulation and Prevnar 13.

Relevant Tests: WBC - 2/14/15 - 13.0 T/MM3; Influenza A and B Swab - 2/14/15 - Negative; Respiratory Virus Antigen Screen - 2/14/15 - Positive; CXR - 2/14/15 - No Focal Pneumonia

INVESTIGATOR TEXT
Pt presented to hospital with fever, cough and respiratory distress. Pt found to be RSV positive and hypoxic. Subject was admitted to hospital on 2/14/15. She was started on O2, breathing treatments, steroids and IV fluids. Subject improved overnight and was discharged from hospital on 2/15/15. Upon discharge subject continued nebulizer treatments and steroids. RSV resolved 2/23/15.
PPD 04.02.2016: TTO 220 days makes causal relationship between Rotarix and LRTI unlikely.

Narrative: This 29-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 2nd dose of Pentacel (intramuscular) on 15th August 2014, for prophylaxis. The subject received the 1st dose of Hepatitis B vaccine (intramuscular) 10 mcg on 30th May 2014, for prophylaxis. The subject received the 2nd dose of Prevnar 13 (intramuscular) on 15th August 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 15th August 2014, for prophylaxis.

Concurrent medical conditions included fever and urinary tract infection.

On PPD 33 days after receiving Pentacel, Prevnar 13 and Rotavirus vaccine lyophilized formulation, 110 after the 1st dose of Hepatitis B vaccine, the subject developed severe - grade 3 febrile seizure. Serious criteria included hospitalization and GSK medically significant. The subject was treated

Narrative: This 8-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 3rd dose of Infanrix hexa (intramuscular) on 4th November 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13 (intramuscular) on 4th November 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 2nd September 2014, for prophylaxis.

On PPD 64 days after receiving Infanrix hexa and Prevnar 13 and 127 days after receiving

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

Rotavirus vaccine lyophilized formulation, the subject developed severe - grade 3 viral gastroenteritis. Serious criteria included hospitalization. The subject was treated with paracetamol (Tylenol), ondansetron (Zofran), sodium chloride and glucose, potassium nos, sodium chloride (Dextrose + Sodium + Potassium). The outcome of viral gastroenteritis was recovered/resolved on 12th January 2015.

The investigator considered that there was no reasonable possibility that the viral gastroenteritis may have been caused by Infanrix hexa, Prevnar 13 and Rotavirus vaccine lyophilized formulation. Diagnostic results (unless otherwise stated, normal values were not provided): On 8th January 2015, Blood calcium result was 9.6 mg/dL (normal low: 9, normal high: 11), Blood chloride result was 105.00 mmol/L (normal low: 96, normal high: 105), Blood creatine result was 0.3 mg/dL (normal low: 0.4, normal high: 1.1), Blood glucose result was 73 mg/dL (normal low: 60, normal high: 100), Blood potassium result was 5.1 mmol/L (normal low: 3.7, normal high: 5.6), Blood sodium result was 138 mmol/L (normal low: 132, normal high: 140), Blood urea result was 14 mg/dL (normal low: 10, normal high: 18) and Carbon dioxide result was 21.0 mmol/L (normal low: 20, normal high: 28).

Investigator Comments:
Patient presented to the ER on 1/8/2015 with a 1 day history of decreased po intake, decreased urine output, 2 episodes of emesis and about 6 loose stools in 24 hours. Based on the history and physical exam, the ER physician diagnosed the patient with viral gastroenteritis and admitted her for IV fluids. In the ER, they gave her a normal saline bolus and then started her on maintenance IV fluids. They also gave her Zofran as needed for nausea/vomiting and Tylenol as needed for fever. The patient was discharged on 1/9/2015
No data on laboratory testing.

On PPD 23:00, 140 days after receiving Infanrix hexa and Prevnar 13 and 197 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed moderate - grade 2 seizure. Serious criteria included hospitalization and GSK medically significant. Additional event(s) included moderate - grade 2 gastroesophageal reflux on 19th February 2015 23:00 with serious criteria of hospitalization and moderate - grade 2 choking on 19th February 2015 23:00 with serious criteria of hospitalization and GSK medically significant. The outcome of seizure was recovered/resolved on 13th February 2015 16:23. The outcome(s) of the additional event(s) included gastroesophageal reflux (recovered/resolved on 21st February 2015 14:30) and choking (resolved with sequelae on 21st February 2015 14:30).

The investigator considered that there was no reasonable possibility that the seizure, gastroesophageal reflux and choking may have been caused by Infanrix hexa, Prevnar 13 and Rotavirus vaccine lyophilized formulation.

Relevant Tests: CXR normal, Abdominal x-ray normal. EKG normal. Head CT normal. All completed on 2/13/15 GI series without KUB: Gastroesophageal reflux intermittent to the midesophagus (2/21/15). EEG normal (2/21/15)

Narrative: This 16-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 1st dose of DTPa vaccine (intramuscular) on 13th July 2015, for prophylaxis. The subject received the 1st dose of Haemophilus influenzae type b vaccine (intramuscular) on 13th July 2015, for prophylaxis. The subject received the 3rd dose of Infanrix hexa (intramuscular) on 25th September 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 30th July 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13 (intramuscular) on 25th September 2014, for prophylaxis.

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

The subject's past medical history included seizures, gastroesophageal reflux, alte and choking.

On PPD 12:40, 19 days after receiving DTPa vaccine and Haemophilus influenzae type b vaccine, 310 days after receiving Infanrix hexa and Prevnar 13 and 1 year and 2 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed moderate - grade 2 petechial rash. Serious criteria included hospitalization. The outcome of petechial rash was recovered/resolved on 13th October 2015 10:15.

The investigator considered that there was no reasonable possibility that the petechial rash may have been caused by DTPa vaccine, Haemophilus influenzae type b vaccine, Infanrix hexa, Rotavirus vaccine lyophilized formulation and Prevnar 13.
Diagnostic results (unless otherwise stated, normal values were not provided): On 1st August 2015, Full blood count result was normal, Metabolic function test result was normal, Platelet count result was normal and Prothrombin time ratio result was normal.

Investigator Text:
Subject seen in our office on 8/1/15 for petechial rash. Sent to ER for work up and further evaluation and admission. All labs WNL. Discharged 8/3/15.Subject was seen in our office on 10/13/15 for a routine scheduled exam. Petechial rash was resolved, healthy exam noted. Subjects admission date was on 01Aug2015, discharge date of 03Aug15.Reported SAE of possible seizure on 2/12/15 is possibly related to ALTE on same date. All diagnostic testing were within normal limits
There is no description on the location of the petechial rash, nevertheless, laboratory results do not indicate a low platelet count nor other abnormal values PT/PTT, blood count, or alteration in other biochemichal parameters, these results argue against an immune mediated thrombocytopenia PPD
17.01.2016: unlikely causal relationship with Rotarix over a year after vaccination

vaccine (intramuscular) 10 µg on 29th September 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 29th July 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13. (intramuscular) on 29th September 2014, for prophylaxis. The subject received the 3rd dose of Pentacel (intramuscular) on 29th September 2014, for prophylaxis.

On PPD 152 days after receiving Hepatitis B vaccine, Prevnar 13. and Pentacel and 214 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed severe - grade 3 respiratory syncytial virus infection. Serious criteria included hospitalization. Additional event(s) included moderate - grade 2 parainfluenzae virus infection on 28th February 2015 with serious criteria of hospitalization and GSK medically significant and moderate - grade 2 community acquired pneumonia on 6th March 2015 with serious criteria of hospitalization and GSK medically significant. The subject was treated with glucose + potassium chloride + sodium chloride (5% Dextrose 1/2 Normal Saline With 20 Meq Of Kcl), amoxicillin, ampicillin, oxygen, ibuprofen (Children'S Motrin), ketorolac trometamol (Toradol), salbutamol (Albuterol) and paracetamol (Tylenol Childrens). The outcome of respiratory syncytial virus infection was recovered/resolved on 13th March 2015. The outcome(s) of the additional event(s) included parainfluenzae virus infection (recovered/resolved on 11th March 2015) and community acquired pneumonia (recovered/resolved on 11th March 2015).

The investigator considered that there was no reasonable possibility that the respiratory syncytial virus infection, parainfluenzae virus infection and community acquired pneumonia may have been caused by Hepatitis B vaccine, Rotavirus vaccine lyophilized formulation, Prevnar 13. and Pentacel.

Relevant Tests: chest x-ray results suggested a possible right sided perihelia pneumonia. Blood Culture was done with no growth in nine hours. This was done on 3/6/2015 Diagnostic results (unless otherwise stated, normal values were not provided): On 7th March 2015, Band neutrophil count result was 18 %, C-reactive protein result was 7.6 % (normal low: 1, normal high: 3), Haematocrit result was 32.3 % (normal low: 33, normal high: 39), Haemoglobin result was 10.6 g (normal low: 10.5, normal high: 13.5), Neutrophil count result was 37 % (normal low: 1.5, normal high: 5), Platelet count result was 396 cells/mm3 (normal low: 300, normal high: 750) and White blood cell count result was 13.5 cells/mm3 (normal low: 6, normal high: 17).

INVESTIGATOR COMMENTS
Per mom symptoms started on 28FEB2015 and became sever enough that they took subject to the hospital on 06MAR2015 where subject was treated and diagnosed with Respiratory Syncytial Virus, Para Influenza, Pneumonia. Subject was released on 11MAR2015 from the hospital. Per mom subject is feeling much better and symptoms are resolved today on 13MAR2015.Symptoms on admit were Respiratory distress, hypoxia, bronchiolitis. Was placed on oxygen via nasal- cannula. Patient was placed on a Biphasic Intermittent Positive Airway Pressure and nasal gastric tube. Then was placed on continuous positive airway pressure and then went to high flow nasal cannula for 3 days. Then improved and was returned to regular nasal cannula. patient was discharged to home on room air and oral antibiotics.
The time to onset is not consistent with a vaccine-related effect.

Non Serious Events:

Suspect Product Name With Formulation, Dose, Units and Frequency**:** [DTPa-HBV-IPV vaccine]:[Solution for injection] <Blank> <Blank> <Blank>;[ActHIB]:[Solution for injection] <Blank> <Blank> <Blank>;[Prevnar 13]:[Solution for injection] <Blank> <Blank> <Blank>;[Rotavirus vaccine lyophilized formulation]:[Oral drops] <Blank> <Blank> <Blank>

Narrative: This 8-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 3rd dose of DTPa-HBV-IPV vaccine (intramuscular) on 5th November 2014, for prophylaxis. The subject received the 3rd dose of ActHIB (intramuscular) on 5th November 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13 (intramuscular) on 5th November 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 29th August 2014, for prophylaxis.

On PPD 63 days after receiving DTPa-HBV-IPV vaccine, ActHIB and Prevnar 13 and 131 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed severe - grade 3 viral gastroenteritis. Serious criteria included hospitalization. The subject was treated with paracetamol (Acetaminophen), ondansetron (Zofran) and d5 1/2 normal saline + potassium chloride. The outcome of viral gastroenteritis was recovered/resolved on 12th January 2015.

The investigator considered that there was no reasonable possibility that the viral gastroenteritis may have been caused by DTPa-HBV-IPV vaccine, ActHIB, Prevnar 13 and Rotavirus vaccine lyophilized formulation.

Relevant Tests: BUN/CREATININE RATIO on10JAN2015 was 48.00 (Normal 7.00-25.00) Diagnostic results (unless otherwise stated, normal values were not provided): On 10th January 2015, Blood chloride result was 123 mmol/L (normal low: 97, normal high: 109), Blood creatine result was 0.50 mg/dL (normal low: 0.7, normal high: 1.2), Blood glucose result was 44 mg/dL (normal low: 65, normal high: 125), Blood sodium result was 144 mmol/L (normal low: 135, normal high: 145) and Blood urea result was 24 mg/dL (normal low: 4, normal high: 15).

Investigator comments:
Subject started having Vomiting, diaarhea and dehydration on January 7, 2015. Subject admitted to ER on January 10, 2015 with a diagnosis of Viiral Gastroenteritis and Dehydration. Subject discharged from hospital on January 12, 2015. -
Report of dehydration from acute gastroenteritis 4.4 months after 2nd dose Rotarix vaccination. Recovery under a week with medical intervention. Viral cause diagnosed. No stool test confirmation.

Narrative: This 6-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 2nd dose of Pentacel (intramuscular) on 4th August 2014, for prophylaxis. The subject received the 2nd dose of Prevnar 13 (intramuscular) on 4th August 2014, for prophylaxis. The subject received the 1st dose of Hepatitis B vaccine (intramuscular) 10 on 2nd June 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (intramuscular) on 4th August 2014, for prophylaxis.

Concurrent medical conditions included gastroenteritis.

On PPD 68 days after receiving Pentacel, Prevnar 13 and Rotavirus vaccine lyophilized formulation and 131 days after receiving Hepatitis B vaccine, the subject developed moderate - grade 2 dehydration. Serious criteria included hospitalization. The subject was treated with Iv Fluids-Sodium Chloride. The outcome of dehydration was recovered/resolved on 14th October 2014.

The investigator considered that there was no reasonable possibility that the dehydration may have been caused by Pentacel, Prevnar 13, Hepatitis B vaccine and Rotavirus vaccine lyophilized formulation.

Relevant Tests: Viral panel positive for pertussis, adenovirus, rhinovirus. the date for this was 10/13/14.

Investigator Comment:
Per mom child has been vomiting quite a bit lately(11 Oct 2014).Child was taken to the ER last night (12 Oct 2014). They ran some tests there.(We are awaiting the results of these tests at this time). Per mother Diaper has been dry for the last 5 hours or so. Per mother child is listless and lethargic. Therefore Dr. felt it was in the best interest of the child to admit to the hospital for IV therapy for dehydration. will report other information as we receive it.

Clinical Narrative report with Both Serious & Non-Serious Events

Randomization Number: UNKNOWN

Case ID: PPD

Serious Events: Lethargy

Non Serious Events:

Suspect Product Name With Formulation, Dose, Units and Frequency: [DTPa-HBV-IPV+Hib vaccine]:[Solution for injection] <Blank> <Blank> <Blank>;[Prevnar 13]:[Solution for injection] <Blank> <Blank> <Blank>;[Rotavirus vaccine lyophilized formulation]:[Oral drops] <Blank> <Blank> <Blank>

Narrative: This female subject was enrolled in the prophylactic open study 117119 (DTPA-HBV-IPV-135). On 01 July 2014, she received a 1st dose of combined diphtheria, tetanus, acellular pertussis, hepatitis B, inactivated polio, Haemophilus influenzae type b vaccine (Infanrix hexa), Pfizer's 13 valent pneumococcal vaccine (Prevenar 13) and rotavirus vaccine (Rotarix lyophilized formulation).

On PPD approximately 6 hours after the 1st dose of Infanrix hexa, approximately 6 hours after the 1st dose of Prevnar 13, and approximately 6 hours after the 1st dose of Rotarix lyophilized formulation, this two-month-old subject developed lethargy event. The subject was hospitalised. The event resolved on 01 July 2014. The investigator considered that there was a reasonable possibility that the lethargy event may have been caused by Infanrix hexa, Prevnar 13 and Rotarix lyophilized formulation. The subject was withdrawn from the study due to this event.

Investigator text :
Baby was given vaccines at 10:20 this morning. At approximately 16:00. Baby was noted by mother to be blue around the lips baby was aroused, and then had 2 more times that this happened and at that time mother noted baby appeared to have some floppiness . Mother also noted some short breathing patterns and it appeared that the baby was having a hard time expelling air. Brought into the Clinic to be examined by the MD. Per exam, it was normal at that time. Baby was admitted to the hospital for observation at this time. No treatment or labs completed. It was observation only. Per the Principal Investigator this SAE is possibly related as there is noted to be a possibility of an lethargic event after episodes that can be traumatic to infants under 3 months of age. It was not a cyanosis , the baby was somewhat hyporesponsive and there was some hypotonia. There is no seizure disorder noted or a family history of seizure disorder.

Narrative: This 16-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 3rd dose of Infanrix hexa (intramuscular) on 10th November 2014, for prophylaxis. The subject received the 1st dose of Haemophilus influenzae type b vaccine (intramuscular) on 30th July 2015, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 15th September 2014, for prophylaxis. The subject received the 1st dose of DTPa vaccine (intramuscular) on 30th July 2015, for prophylaxis. The subject received the 3rd dose of Prevnar 13. (intramuscular) on 10th November 2014, for prophylaxis.

Concomitant products included paracetamol (Tylenol).

On PPD 303 days after receiving Infanrix hexa and Prevnar 13., 41 days after receiving Haemophilus influenzae type b vaccine and DTPa vaccine and 359 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed severe - grade 3 dehydration. Serious criteria included hospitalization. The subject was treated with glucose + potassium chloride + sodium chloride (5% Dextrose + 0.9% Sodium Chloride + 20 Meq Potassium Chloride), sodium chloride (Normal Saline Bolus) and ondansetron (Zofran). The outcome of dehydration was recovered/resolved on 11th September 2015.

The investigator considered that there was no reasonable possibility that the dehydration may have been caused by Infanrix hexa, Haemophilus influenzae type b vaccine, Rotavirus vaccine lyophilized formulation, DTPa vaccine and Prevnar 13..

Relevant Tests: CBC was with in normal limits.

Investigator comments :
Patient fell and hit head on the evening of 9/8/2015. Was acting fine that night . on the morning of 9/9/2015 patient started vomiting. Seen in clinic about noon and physician told mother to call with concerns if not improved later in the evening. Mother call into the clinic and talked to MD. and patient was admitted to the hospital for dehydration. Patient was started on IV therapy. Per physician he feels the dehydration is a stomach virus as there are other family members that are starting to exhibit the same symptoms today (9/10/2015). The head injury and vomiting will be listed as A/E. Patient was discharged from the hospital 9/11/2015.
PPD 15.09.2015: Onset about a year after Rotarix makes causal relationship unlikely. The report suggests a gastroenteritis due to an infectious agent may be responsible for the child's symptoms.

Narrative: This 2-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 1st dose of DTPa-HBV-IPV+Hib vaccine (intramuscular) on 9th July 2014, for prophylaxis. The subject received the 1st dose of Prevnar 13 (intramuscular) on 9th July 2014, for prophylaxis. The subject received the 1st dose of Rotavirus vaccine lyophilized formulation (oral) on 9th July 2014, for prophylaxis.

On PPD less than a day after receiving DTPa-HBV-IPV+Hib vaccine, Prevnar 13 and Rotavirus vaccine lyophilized formulation, the subject developed moderate - grade 2 apparent life threatening event. Serious criteria included hospitalization, GSK medically significant and life threatening. Additional event(s) included mild - grade 1 leukocytosis on 9th July 2014 with serious criteria of hospitalization and life threatening. DTPa-HBV-IPV+Hib vaccine was continued with no change. Prevnar 13 was continued with no change. The action taken with Rotavirus vaccine lyophilized formulation was unknown. The outcome of apparent life threatening event was recovered/resolved on 9th July 2014. The outcome(s) of the additional event(s) included leukocytosis (recovered/resolved on 10th July 2014).

The investigator considered that there was a reasonable possibility that the apparent life threatening event and leukocytosis may have been caused by DTPa-HBV-IPV+Hib vaccine, Prevnar 13 and Rotavirus vaccine lyophilized formulation.

Relevant Tests: CBC with manual Difficile which showed white blood count that was slightly elevated at 20,000 and a little mildly elevated lactic acid. and urine culture and blood culture was negative so far. CRP was 20 but on the normal level would be 2. Diagnostic results (unless otherwise stated, normal values were not provided): On an unknown date, Blood culture result was negative unknown. On an unknown date, C-reactive protein result was 20 unknown. On an unknown date, Culture urine result was negative unknown. On an unknown date, White blood cell count result was 20000 unknown.

Investigator comments: On the evening of the 09 July 2014 baby was very irritable then finally went to sleep. Mom went to check on the baby and the skin was pale and the lips were pale, breathing was noted to be very shallow and baby tried to go back to sleep. Lips were not blue at all. Mom states that the baby acts like she is trying to let out a big cry and can't quite get it out. Was instructed by the afterhours nurse on call to take baby to the ER to be evaluated. Baby was taken in and from there admitted to the hospital. Baby did well with some mild fussiness and decreased stooling. Was discharged from the hospital on 10 July 2014. Baby is to return to the clinic for a check up on 11 July 2014. Mom also reported limp floppy extremities. This didn't occur after breast feeding or immediately after.No relevant medical history. No history of seizure disorder in family. No x-rays taken. Due to the time frame of onset and the test results it

INVESTIGATOR TEXT
Subject was admitted to hospital on 04/24/2015 after he was treated in the emergency room on 04/24/2015. Medical history: 1-2 days prior had history of congestion, cough and started wheezing. Parent brought subject into the clinic and subject has low oxygen saturations of 70 to 80. Nurse practioner sent subject to the emergency room after giving a albuterol nebulizer treatment. At the emergency room subject was stabilized with continuous albuterol treatments and admitted to the hospital for continued care. Once admitted, albuterol treatments and oxygen were continuous for approximately 12 hours then subject was weaned down to albuterol treatments every 2 hours and oxygen was rapidly weaned to room air. At discharge, parent was to continue albuterol treatments every 4 hours as needed. No oxygen for home. Subject discharged to home on 04/25/2015.
The time to onset from vaccination of 163 days is not consistent with a vaccine-related effect.

The subject received the 4th dose of Pentacel (intramuscular) on 30th July 2015, for prophylaxis. The subject received the 2nd dose of Hepatitis B vaccine (intramuscular) 10 ug on 30th October 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13 (intramuscular) on 30th October 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (intramuscular) on 19th August 2014, for prophylaxis.

On PPD 25 days after receiving Pentacel, 298 days after receiving Hepatitis B vaccine and Prevnar 13 and 1 year and 5 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed moderate - grade 2 seizure like phenomena. Serious criteria included hospitalization and GSK medically significant. The subject was treated with lidocaine, levetiracetam (Keppra (Levetiracetam)), Keppra, glucose, sodium chloride (5% Dextrose + Sodium Chloride Solution), ketamine and dexmedetomidine hydrochloride (Precedex). The outcome of seizure like phenomena was

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

recovered/resolved on 1st September 2015.

The investigator considered that there was no reasonable possibility that the seizure like phenomena may have been caused by Pentacel, Hepatitis B vaccine, Prevnar 13 and Rotavirus vaccine lyophilized formulation.

Relevant Tests: Renal Function Panel Results: Abnormal, Albumin 5.0 (H), range (3.0- 4.8 g/dL) test date: 08/27/2015 unremarkable. EKG and ECHO returned unremarkable test, EKG showed sinus rhythm, no deltas appreciated date: 08/28/2015. EEG on 08/27/15 interpretation: this video EEG tracing in the awake, drowsey and asleep state is normal. There were no electroclinical seizures. No evidence of any epileptiform or focal abnormalities. EEG on 08/28/15 Interepretation: This EEG tracing in the awake, drowsey and asleep state with photic stimulation is normal. Clinical correlation is recommended. MRI Head without contrast on 08/28/2015: Impression: Unremarkable MRI of the brain.

Investigator Text:
The subject is a 15 month old born by induced vaginal delivery at 37 weeks due to intrauterine growth restriction with a history of neonatal hyperbilirubinemia treated with phototherapy and seasonal allergies formerly trated with claritin who presents to the emergency room with 4 episodes of seizure-like activity. During these episodes, she tenses up, makes choking noises, and her eyes deviate upwards. After these episodes on the first two nights and again this morning(08/27/15), she cried, appeared temporarily disoriented, and then acted fussy for a few minutes. During the episode last night (08/26/15) she did not seem to be post-ictal. Nursing reports that the subject had an observed 1-minute period of tachycardia to 240 bpm accompanied by inactivity but no obvious change in mental status. She was breathing during this episode. Her immunizations are up to date. She has been out of daycare since 07/28/2015 and no known sick contacts or recent travel. There is no family history of
arrhythmia or epilepsy. She eats table food and drinks milk, juice, and water. She has been making 5-7 wet and 2-3 dirty diapers a day. Child remains in the hospital at the initial SAE report on 08/28/2015. Study staff spoke with parent today to inquire about the start date, parent reported via telephone started having first episode on Monday evening at home on 08/24/2015. Child admitted to the hospital on the afternoon of 08/27/2015.
Follow up report as of 09/01/15: Hospital course: Upon admission child remained stable without any seizure like activity observed. She continued on KEPPRA 15mg/kg twice a day. Neurological evaluation with EEG and MRI returned unremarkable. Cardiology consultation was placed given tachycardia in ED, concerning fr underlying arrhytmia. Cardiac evaluation with EKG and ECHO returned unremarkable. Decision was made to discharge child as she remained clinically stable without any noted seizure like activity and adequate appetite and oral intake. The child has undergone EEG which was normal. At this point and time impression was that this child is likely having frontal lobe seizures resulting in these events. These episodes are not related to reflux, choking, or obstructive sleep apnea. KEPPRA was started. Family educated about seizures. Suggested primary care MD to make referral to pediatric sleep medicine to evaluate snoring. Child was discharged home with seizure like activity nocturnal
partial seizures, and placed on KEPPRA. Discharged from hospital on 08/29/2015. Parent took the child back to the ED on 08/31/15. Mom stated she noticed an episode of twitching of her right arm andone leg in her sleep lasting 20 seconds and self resolving. The child's eyes were closed. Neuro was consulted in the ED who deferred change in medication at this visit. Parent was instructed to follow up with primary MD. Child was discharged from the ED on 08/31/15. Chil went to primary MD office for ER follow up on 09/01/15. Plan from the follow up visit: child referred to sleep medicine on 08/31/15 for snoring, continue KEPPRA as prescribed. Mom was requested by primary MD to call neurology to schedule an appointment as soon as possible. There is no more information available. Update on 09/25/2015, spoke with parent today she reports the child has not experienced any new seizure like episodes since the follow up visit on

09/01/2015, initial hospitalized event has resolved per parent report.
TTO implausible for causality due to Hepatitis B or Rotavirus vaccine

Study Number: 117119

Study Center ID: PPD

Subject ID: PPD

Randomization Number: UNKNOWN

Case ID: PPD

Serious Events: Respiratory distress, Respiratory syncytial virus bronchiolitis

Non Serious Events:

Suspect Product Name With Formulation, Dose, Units and Frequency**:** [DTPa-HBV-IPV+Hib vaccine]:[Solution for injection] <Blank> <Blank> <Blank>;[Prevnar 13]:[Solution for injection] <Blank> <Blank> <Blank>;[Rotavirus vaccine lyophilized formulation]:[Oral drops] <Blank> <Blank> <Blank>

Narrative: This 6-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 3rd dose of Infanrix hexa (intramuscular) on 3rd November 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13 (intramuscular) on 3rd November 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 8th September 2014, for prophylaxis.

On PPD 28 days after receiving Infanrix hexa, 28 days after receiving Prevnar 13 and 84 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed severe - grade 3 respiratory syncytial virus bronchiolitis. Serious criteria included hospitalization and GSK medically significant. Additional event(s) included severe - grade 3 respiratory distress on 7th December 2014 with serious criteria of hospitalization and GSK medically significant. The subject was treated with furosemide (Lasix), paracetamol (Tylenol), salbutamol (Albuterol), 5% dextrose + normal saline solution, ibuprofen and sucrose (Sucrose Oral Solution). The outcome of respiratory syncytial virus bronchiolitis was recovered/resolved on 12th December 2014. The outcome(s) of the additional event(s) included respiratory distress (recovered/resolved on 12th December 2014).

The investigator considered that there was no reasonable possibility that the respiratory syncytial virus bronchiolitis and respiratory distress may have been caused by Infanrix hexa, Prevnar 13 and Rotavirus vaccine lyophilized formulation.

Relevant Tests: Respiratory Panel: 07Dec2014, RSV positive, Flu negative.
Chest X-ray: 07Dec2014, showed viral illness Blood culture: 07Dec2014, no growth Urine culture: 07Dec2014: no growth

Investigator Comment:
On 07 Dec 2014, subject's mother brought her to the ER with a 1-week history of cough, congestion, and

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

rhinorrhea. Approximately 3 days prior, fever, worsening cough, decreased intake and decreased urine output as well as loose stools and increased sleepiness and increased work of breathing was noted by the mother. Mother brought the subject to the ER in the early morning hours of 07Dec2014 due to those worsening symptoms. In the ER, subject presented with grunting, lethargy, oxygen saturation of 84%, and was treated with suctioning, oxygen by mask. Work of breathing was still increased and subject's temperature was 105F. Subject was then admitted to the hospital service for 23-hour observation. No familial risk factors were noted. Care included nasal suctioning, breathing treatments and supportive care. In the morning of 08Dec2014, increased work of breathing and tachypnea was noted, and subject was transferred to the Pediatric Intensive Care Unit for increased care and management.Respiratory panel returned with positive for Repiratory Syncitial Virus. While in the Pediatric Intensive Care Unit, subject required up to 15 liters of 100% Oxygen via Vapotherm, and was weaned down to 5L of 28%. Subject was transferred to the general care floor on 10Dec2014 and was weaned to room air on the evening of 11Dec2014. She continued to require suctioning until 24 hours prior to discharge. Subject was discharged on 12Dec2014. Subject was well at discharge.
RSV bronchiolitis 28 days after multiple vaccines. RSV bronchiolitis is a risk for infants of this age, regardless of the vaccination administered. In this case, due to co-administration of several vaccines, an individual assessment of causality cannot be made.

Serious Events: Mental status changes

Non Serious Events:

Suspect Product Name With Formulation, Dose, Units and Frequency**:** [Pentacel]:[Solution for injection] <Blank> <Blank> <Blank>;[Hepatitis B vaccine]:[Solution for injection] <Blank> <Blank> <Blank>;[Prevnar 13]:[Solution for injection] <Blank> <Blank> <Blank>;[Rotavirus vaccine lyophilized formulation]:[Oral drops] <Blank> <Blank> <Blank>

Narrative: This 9-month-old male subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 3rd dose of Pentacel (intramuscular) on 11th November 2014, for prophylaxis. The subject received the 2nd dose of Hepatitis B vaccine (intramuscular) 10 ug on 11th November 2014, for prophylaxis. The subject received the 3rd dose of Prevnar 13 (intramuscular) on 11th November 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 15th September 2014, for prophylaxis.

On PPD 108 days after receiving Pentacel, Hepatitis B vaccine and Prevnar 13 and 165 days after receiving Rotavirus vaccine lyophilized formulation, the subject developed severe - grade 3 mental status changes. Serious criteria included hospitalization. The subject was treated with sodium

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

chloride (Sodium Chloride Infusion), lidocaine (Lidocain) and naloxone hydrochloride (Narcan (Naloxone)). The outcome of mental status changes was recovered/resolved on 28th February 2015.

The investigator considered that there was no reasonable possibility that the mental status changes may have been caused by Pentacel, Hepatitis B vaccine, Prevnar 13 and Rotavirus vaccine lyophilized formulation.

Relevant Tests: The following blood tests were also conducted: Ethanol: Negative. Salicylate: less tha 1.0 mg/dl (range 2-20). Valproic Acid: less tha 10.0 ug/mL (range 50-150). Diff-Cells Counted: 114. Atypical lymph%: 11 10*3/ul (range 0-8). Atypical lymph#: 1.3, (range 0-1.4). Poikilocytes: 1+(A). Ovalocytes: 1+(A). Platelet Estimate: Adequate. Urine Culture: Rpt. Acetaminophen: less tha 10.0 ug/ml (range 10-30). Amphetamine - Urine screen: Negative. Barbiturate - Urine Screen: Negative. Benzodiazepine Screen - Urine: Negative. Cocaine/Metab-Urine Screen: Negative.Opiates - Urine: Negative. Cannabinoids - Urine Screen: Negative. Tricyclics - Urine Screen: Negative. Diagnostic results (unless otherwise stated, normal values were not provided): On 27th February 2015, Alanine aminotransferase result was 40 u/L (normal low: 13, normal high: 69), Amylase result was 130 u/L (normal low: 30, normal high: 110), Aspartate aminotransferase result was 48 u/L (normal low: 15, normal high: 46), Basophil count result was 1 % (normal low: 0.00, normal high: 2), Basophil count result was 0.12 unknown (normal low: 0.00, normal high: 0.4), Blood albumin result was 4.3 g/dL (normal low: 3, normal high: 4.8), Blood alkaline phosphatase result was 252 u/L (normal low: 80, normal high: 270), Blood bilirubin result was 0.3 mg/dL (normal low: 0.00, normal high: 0.9), Blood calcium result was 10.0 mg/dL (normal low: 8.6, normal high: 11.2), Blood chloride result was 103 NA (normal low: 98, normal high: 107), Blood creatinine result was 0.3 mg/dL (normal low: 0.3, normal high: 0.5), Blood glucose result was 99 mg/dL (normal low: 60, normal high: 100), Blood potassium result was 4.4 NA (normal low: 3.5, normal high: 5.1), Blood sodium result was 138 NA (normal low: 132, normal high: 142), Blood urea result was 8 mg/dL (normal low: 4, normal high: 15), Carbon dioxide result was 20 NA (normal low: 18, normal high: 27), Eosinophil count result was 1 % (normal low: 0.00, normal high: 7), Eosinophil count result was 0.12 unknown (normal low: 0.00, normal high: 1.2), Haematocrit result was 38.2 % (normal low: 30, normal high: 42), Haemoglobin result was 12.8 g/dL (normal low: 10.5, normal high: 13.5), Lymphocyte count result was 62 % (normal low: 35, normal high: 74), Lymphocyte count result was 7.17 unknown (normal low: 2.1, normal high: 13), Mean cell haemoglobin result was 25.0 pg (normal low: 25, normal high: 31), Mean cell haemoglobin concentration result was 33.5 g/dL (normal low: 29, normal high: 37), Mean cell volume result was 74.6 fL (normal low: 70, normal high: 86), Mean platelet volume result was 9.5 fL (normal low: 6.7, normal high: 10.8), Monocyte count result was 14 % (normal low: 0.00, normal high: 15), Monocyte count result was 1.62 unknown (normal low: 0.00, normal high: 2.6), Neutrophil count result was 11 % (normal low: 16, normal high: 48), Neutrophil count result was 1.27 unknown (normal low: 1, normal high: 8.4), Platelet count result was 292 unknown (normal low: 140, normal high: 440), Protein total result was 6.8 g/dL (normal low: 5, normal high: 7.5), Red blood cell count result was 5.12 unknown (normal low: 3.7, normal high: 5.3), Red cell distribution width result was 13.3 % (normal low: 14.1, normal high: 21.6) and White blood cell count result was 11.57 unknown (normal low: 6, normal high: 17.5).

Investigator text:
On 27Feb2015, subject was in the care of grandparents for the day. When the subject's mother arrived to pick him up, around 0810 PM, he was drowsy and not acting like himself. Grandparents reported that the subject had slept 6-7 hours straight that afternoon. No known injury or ingestion was reported by the grandparents. Subject was taken to an Immediate Care Center and was minimally responsive there, so subject was transported via ambulance to the local children's hospital Emergency Department. There, he was minimally responsive to sternal rubs and had fixed pupils. Vital signs were stable. He did not respond when the IV was placed. After receipt of 1 gm of Narcan, he immediately began to respond, and within 15

Confidential
Clinical Narrative report with Both Serious & Non-Serious Events

minutes was back to normal behavior. Urine and serum toxicity screenings were negative, and EKG shows sinus arrhythmia. Subject was sent to the floor for observation and the remainder of the hospitalization was unremarkable. He was discharged on 28 February 2015 after the shorthospital stay.Final discharge diagnosis was Altered Mental State. Per mother's report today (02Mar2015) subject is doing fine. She reported that they feel that the subject must have ingested one of the many pills that the grandparents have in their home. The start date 27 FEB 2015= date of first signs and symptoms.

Narrative: This 5-month-old female subject was enrolled in an open label study titled A phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa' vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar and Rotarix with a booster dose of GSK Biologicals' Infanrix and Hiberix vaccines at 15-18 months of age. The subject received the 2nd dose of Pentacel (intramuscular) on 13th August 2014, for prophylaxis. The subject received the 1st dose of Hepatitis B vaccine (intramuscular) 10 mcg on 18th June 2014, for prophylaxis. The subject received the 2nd dose of Prevnar 13 (intramuscular) on 13th August 2014, for prophylaxis. The subject received the 2nd dose of Rotavirus vaccine lyophilized formulation (oral) on 13th August 2014, for prophylaxis.

On PPD 32 days after receiving Pentacel, Prevnar 13 and Rotavirus vaccine lyophilized formulation and 88 days after receiving Hepatitis B vaccine, the subject developed moderate - grade 2 PPD Serious criteria included hospitalization. The outcome of PPD was recovered/resolved on 15th September 2014.

The investigator considered that there was no reasonable possibility that the PPD may have been caused by Pentacel, Hepatitis B vaccine, Prevnar 13 and Rotavirus vaccine lyophilized formulation.

Relevant Tests: chest xray Negative

138	1899.9	134	2250.0	0.84	0.61	1.16

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
Adjusted GMC/T = geometric mean antibody concentration/titer adjusted for Tdap vaccination of the mother and Hepatitis B vaccination of the subject
N = Number of subjects with both pre- and post-primary vaccination results available
95% CI = 95% confidence interval for the adjusted GMC ratio (ANCOVA model: adjustment for Tdap vaccination of mother and Hepatitis B vaccination history of the subject - pooled variance); LL = lower limit, UL = upper limit

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
GMC = geometric mean antibody concentration calculated on all subjects
N = number of subjects with available results
n/% = number/percentage of subjects with concentration equal to or above specified value
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
PRE-BST = Pre booster vaccination at Month 13-16 (Visit 5)
POST-BST = Post booster vaccination at Month 14-17 (Visit 6)
Note: The assay cut off is 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA, and 2.187 IU/mL for anti-PRN.

Table 7.27 Booster response for anti-PT, anti-FHA and anti-PRN antibodies, one month post booster vaccination - by gender (Booster ATP cohort for immunogenicity)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
Booster response to PT, FHA and PRN antigens is defined as:
For subjects with pre-vaccination antibody concentration below the assay cut off, post-vaccination antibody concentration = 4 times the assay cut-off,
For subjects with pre-vaccination antibody concentration between the assay cut off and below 4 times the assay cut-off, post-vaccination antibody concentration equal or above 4 times the pre-vaccination antibody concentration,
For subjects with pre-vaccination antibody concentration equal or above 4 times the assay cut off, post-vaccination antibody concentration equal or above 2 times the pre-vaccination antibody concentration
N = number of subjects with pre- and post-vaccination results available
n/% = number/percentage of subjects with booster response
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
Note: The assay cut off is 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA, and 2.187 IU/mL for anti-PRN.

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
Booster response to PT, FHA and PRN antigens is defined as:
For subjects with pre-vaccination antibody concentration below the assay cut off, post-vaccination antibody concentration = 4 times the assay cut-off,
For subjects with pre-vaccination antibody concentration between the assay cut off and below 4 times the assay cut-off, post-vaccination antibody concentration equal or above 4 times the pre-vaccination antibody concentration,
For subjects with pre-vaccination antibody concentration equal or above 4 times the assay cut off, post-vaccination antibody concentration equal or above 2 times the pre-vaccination antibody concentration
N = number of subjects with pre- and post-vaccination results available
n/% = number/percentage of subjects with booster response
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
Note: The assay cut off is 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA, and 2.187 IU/mL for anti-PRN.

Table 7.30 Number and percentage of subjects with anti-D and anti-T antibody concentration equal to or above the assay cut-off, 0.1 IU/mL and 1.0 IU/mL and geometric mean concentration (GMC), before and one month post booster vaccination - by gender (Booster ATP cohort for immunogenicity)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
Booster response to PT, FHA and PRN antigens is defined as:
For subjects with pre-vaccination antibody concentration below the assay cut off, post-vaccination antibody concentration = 4 times the assay cut-off,
For subjects with pre-vaccination antibody concentration between the assay cut off and below 4 times the assay cut-off, post-vaccination antibody concentration equal or above 4 times the pre-vaccination antibody concentration,
For subjects with pre-vaccination antibody concentration equal or above 4 times the assay cut off, post-vaccination antibody concentration equal or above 2 times the pre-vaccination antibody concentration
N = number of subjects with pre- and post-vaccination results available

n/% = number/percentage of subjects with booster response
95% CI = 95% confidence interval; LL = Lower Limit, UL = Upper Limit
Note: The assay cut off is 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA, and 2.187 IU/mL for anti-PRN.

Table 7.61 Number and percentage of subjects with anti-D and anti-T antibody concentration equal to or above the assay cut-off, 0.1 IU/mL and 1.0 IU/mL and geometric mean concentration (GMC), before and one month post booster vaccination (Booster Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
For each dose and overall/subject:
N = number of subjects with at least one administered dose
n/% = number/percentage of subjects presenting at least one type of symptom whatever the study vaccine administered
For overall/dose:
N = number of administered doses
n/% = number/percentage of doses followed by at least one type of symptom whatever the study vaccine administered
95% CI = exact 95% confidence interval, LL = Lower Limit, UL = Upper Limit

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
For each dose and overall/subject:
N = number of subjects with at least one documented dose
n/% = number/percentage of subjects reporting the symptom at least once
For Overall/dose:
N = number of documented doses
n/% = number/percentage of doses followed by at least one type of symptom
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit

Table 8.10 Incidence of solicited local symptoms reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall – by geographical ancestry (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
For each dose and overall/subject:
N = number of subjects with at least one documented dose
n/% = number/percentage of subjects reporting the symptom at least once
For Overall/dose:
N = number of documented doses
n/% = number/percentage of doses followed by at least one type of symptom
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit

Table 8.11 Incidence of solicited general symptoms reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall- by gender (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
For each dose and overall/subject:
N = number of subjects with at least one documented dose
n/% = number/percentage of subjects reporting the symptom at least once
For Overall/dose:
N = number of documented doses
n/% = number/percentage of doses followed by at least one type of symptom
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit

Table 8.12 Incidence of solicited general symptoms reported during the 4-day (Days 0-3) post-vaccination period following each priming dose and overall- by geographical ancestry (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
For each dose and overall/subject:
N = number of subjects with at least one documented dose
n/% = number/percentage of subjects reporting the symptom at least once
For Overall/dose:
N = number of documented doses
n/% = number/percentage of doses followed by at least one type of symptom
95%CI = Exact 95% confidence interval; LL = lower limit, UL = upper limit

Table 8.13 Percentage of doses with unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following priming doses (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine

At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with at least one administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 8.20 Percentage of subjects reporting the occurrence of unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following priming doses– by geographical ancestry (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with at least one administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 8.21 Percentage of subjects reporting the occurrence of grade 3 unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following priming doses- by gender (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with at least one administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 8.23 Percentage of subjects reporting the occurrence of unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term with causal relationship with vaccination, within the 31-day (Days 0-30) post-vaccination period following priming doses – by gender (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of administered doses
n/% = number/percentage of doses with the symptom
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 8.28 Percentage of doses with unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following priming doses– by geographical ancestry (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of administered doses
n/% = number/percentage of doses with the symptom
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 8.29 Percentage of doses with grade 3 unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following priming doses- by gender (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of administered doses
n/% = number/percentage of doses with the symptom
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 8.31 Percentage of doses with unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term with causal relationship with vaccination, within the 31-day (Days 0-30) post-vaccination period following priming doses – by gender (Primary Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines

Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines

Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine

For each dose and overall/subject:

N = number of subjects with at least one administered dose

n/% = number/percentage of subjects who started to take the specified concomitant medication at least once during the mentioned period

For overall/dose:

N = number of administered doses

n/% = number/percentage of doses after which the specified concomitant medication was started at least once during the mentioned period

95% CI = exact 95% confidence interval, LL = Lower Limit, UL = Upper Limit

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with the administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 8.64 Percentage of subjects reporting the occurrence of unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following the booster dose-by geographical ancestry (Booster Total vaccinated cohort)

Hexa group = Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
Pedia group = Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
Penta group = Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine
At least one symptom = at least one symptom experienced (regardless of the MedDRA Preferred Term)
N = number of subjects with the administered dose
n/% = number/percentage of subjects reporting the symptom at least once
95% CI = exact 95% confidence interval; LL = Lower Limit, UL = Upper Limit

Table 8.65 Percentage of subjects reporting the occurrence of grade 3 unsolicited symptoms classified by MedDRA Primary System Organ Class and Preferred Term within the 31-day (Days 0-30) post-vaccination period following the booster dose-by gender (Booster Total vaccinated cohort)

Protocol Amendment 2 Rationale

Amendment number: Amendment 2
Rationale/background for changes: The amendment 2 has been implemented to amend the following sections of the protocol: • The assay for testing antibodies against polyribosyl ribitol phosphate (anti-PRP) has been re-developed but is not yet qualified or validated for testing the one month post dose-3 samples. This has been clarified in the protocol in Table 7 Humoral immunity (antibody determination) and Section 5.7.3 Laboratory assays. • Investigator sign-off on the patient identification (PIDS) will be done after Visit 4 instead of extended safety follow-up (ESFU). In Table 4 List of study procedures, the bullets pertaining to investigator sign-off and analysis of Epoch 001 has been removed from the ESFU visit and retained at Visit 4 to reflect this change. • The collection of baseline measurement of limb length has been removed since it will not be used in analysis; only limb circumference will be used in analysis. Accordingly, text related to this has been amended in Table 4 List of study procedures, Sections 5.6.2.11, Baseline measurement of limb circumference after booster vaccination at visit 5 and 5.6.2.13 Recording of AEs, SAEs and NOCDs. • Errors in the vaccines dictionary of Study Master Repository (SMR) have been rectified for *Infanrix hexa*, *Pediarix* and *Pentacel* vaccines. The corresponding correction has been made in Table 9 Study vaccines. • The sequence of analysis in Section 10.9.1 Sequence of analyses, has been amended to reflect that there will first be an analysis of immunogencity for anti-PRP and safety for Epoch 001, followed by a final analysis covering both Epochs at the end of the study.

CONFIDENTIAL

Protocol Amendment 2 Investigator Agreement

I agree:

- To conduct the study in compliance with this protocol, any future protocol amendments or protocol administrative changes, with the terms of the clinical trial agreement and with any other study conduct procedures and/or study conduct documents provided by GlaxoSmithKline (GSK) Biologicals.
- To assume responsibility for the proper conduct of the study at this site.
- That I am aware of, and will comply with, 'Good Clinical Practice' (GCP) and all applicable regulatory requirements.
- To ensure that all persons assisting me with the study are adequately informed about the GSK Biologicals' investigational vaccine and other study-related duties and functions as described in the protocol.
- To acquire the reference ranges for laboratory tests performed locally and, if required by local regulations, obtain the laboratory's current certification or Quality Assurance procedure manual.
- To ensure that no clinical samples (including serum samples) are retained onsite or elsewhere without the approval of GSK Biologicals and the express written informed consent of the subject and/or the subject's legally acceptable representative.
- To perform no other biological assays on the clinical samples except those described in the protocol or its amendment(s).
- To co-operate with a representative of GSK Biologicals in the monitoring process of the study and in resolution of queries about the data.
- That I have been informed that certain regulatory authorities require the sponsor to obtain and supply, as necessary, details about the investigator's ownership interest in the sponsor or the investigational vaccine, and more generally about his/her financial ties with the sponsor. GSK Biologicals will use and disclose the information solely for the purpose of complying with regulatory requirements.

Hence I:

- Agree to supply GSK Biologicals with any necessary information regarding ownership interest and financial ties (including those of my spouse and dependent children).
- Agree to promptly update this information if any relevant changes occur during the course of the study and for one year following completion of the study.
- Agree that GSK Biologicals may disclose any information it has about such ownership interests and financial ties to regulatory authorities.
- Agree to provide GSK Biologicals with an updated Curriculum Vitae and other documents required by regulatory agencies for this study.

SYNOPSIS

Detailed Title

A Phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa™ vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar® and Rotarix™ with a booster dose of GSK Biologicals' Infanrix® and Hiberix™ vaccines at 15-18 months of age.

Indication

Active immunization against diphtheria, tetanus, pertussis infection caused by all known subtypes of hepatitis B virus, poliomyelitis, and invasive disease caused by *Haemophilus influenzae* type B (Hib) in infants.

Rationale for the study and study design

- **Rationale for the study**

Infanrix hexa was first licensed in the European Union in 2000. More than 100 million doses have been distributed to date and the benefit/risk profile remains favorable. Licensure of *Infanrix hexa* combination vaccine in the United States (US) will provide an additional option for vaccination within the routine US pediatric schedule with the fewest number of injections, which would create opportunities to add further injections in case other novel vaccines against important pediatric diseases become available. Furthermore, *Infanrix hexa* will provide an additional source of DTaP, hepatitis B, poliovirus, and Hib-containing vaccine to the US market, which will help ensure a more stable supply.

The present study 117119 (DTPA-HBV-IPV-135) is intended to generate pivotal immunogenicity data demonstrating non-inferiority of the immune responses against pertussis antigens of *Infanrix hexa* compared to *Pediarix,* which is currently one of the DTaP combination vaccines widely used as a standard of care in the US. Additionally, this study will also provide descriptive data with regard to the immunogenicity of the other vaccine antigens and the safety profile in US subjects. These pivotal immunogenicity non-inferiority data for pertussis and descriptive safety data are intended to support the registration of GSK Biologicals' combined DTPa-HBV-IPV/Hib (*Infanrix hexa*) vaccine in the US. A subsequent Phase III study is planned to provide pivotal data regarding lot-to-lot consistency, safety and the immunogenicity of the other vaccine antigens.

Comparison of immunogenicity data from separate clinical studies for *Infanrix hexa* and *Pentacel*, given on a 2-4-6 month schedule, suggests that the immune response to the Hib

component of these vaccines is similar. This study will provide descriptive information regarding the immune response to the Hib components of *Infanrix hexa* and *Pentacel* following a 3 dose primary series, prior to further evaluation in Phase III studies.

- **Rationale for the study design**

Design of Epoch 001 (primary vaccination):

The study is designed as a randomized, controlled, open-label study with five parallel groups:

- The first three groups (Hexa_1, Hexa_2 and Hexa_3 group) will receive three doses of the *Infanrix hexa* vaccine (either lot A, lot B or lot C, respectively). These three groups will be pooled together for the analyses and the pooled group will be called the Hexa group.
- The Pedia Group (Control 1) will receive three doses of the US-licensed control vaccines, *Pediarix* and *ActHIB*.
- The Penta Group (Control 2) will receive three doses of the US-licensed control vaccines, *Pentacel* (only two doses of *Engerix-B* will be administered if a subject has received a birth dose of hepatitis B vaccine).

Three distinct vaccine lots manufactured according to the same procedures will be used in the Hexa group in order to obtain more representative data for the vaccine.

The study will be open-label due to the differences in the number of injections and the appearance of the vaccines administered.

Vaccines (i.e., *Prevnar13* and *Rotarix*) that are recommended for children in the US during the first year of life will be administered concomitantly with the other study vaccines as part of the study.

Design of Epoch 002 (booster vaccination):

In Epoch 002, the subjects will be assessed for antibody persistence to the vaccine antigens of *Infanrix hexa*. This epoch will also assess the adequacy of priming subjects with *Infanrix hexa* by evaluating the boostability of D, T, Pa and Hib antigens with the US-licensed vaccines. The pooled Hexa Group will receive booster doses of *Infanrix* and *Hiberix* vaccines at 15 through 18 months of age, the subjects in the Penta Group will receive *Pentacel* vaccine as a booster, and

the subjects in the Pedia Group will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15 through 18 months of age.

The study will continue to be open-label in Epoch 002.

Objectives

Primary

Epoch 001 (primary vaccination)

- To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens [pertussis toxoid (PT), filamentous hemagglutinin (FHA) and pertactin (PRN)] one month after the third dose of the primary vaccination.

  Criteria for non-inferiority:

  Non-inferiority in terms of immune response to pertussis antigens will be demonstrated if, for each of the three antigens, the upper limit of the 95% confidence interval (CI) on the GMC ratio [Pedia divided by Hexa] is ≤ 1.5.

Secondary

Epoch 001 (Primary vaccination)

- To assess the immune response to *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to D, T, HBs, pertussis, poliovirus types 1, 2 and 3 and PRP antigens, one month after the third dose of the primary vaccination.
- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa,* of *Pentacel* co-administered with *Engerix-B,* and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events, new-onset chronic diseases (NOCDs) and serious adverse events.

Epoch 002 (Booster vaccination)

- To assess the immunogenicity of *Infanrix hexa, Pentacel, Engerix-B, Pediarix* and *ActHIB,* in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.

- To assess the immune response to *Infanrix, Hiberix, ActHIB* and *Pentacel,* in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix and Pentacel*, one month after the booster dose.
- To assess the safety and reactogenicity of booster doses of *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*.

Study design

- Experimental design: Phase III, open-label, randomized, controlled, multi-centric, single-country study with five parallel groups.
- Duration of the study: The intended duration of the study per subject is approximately 14-17 months.
  - **Epoch 001**: Primary, starting at Visit 1 (Day 0) and ending at safety follow up contact (i.e. six months following the third dose, Month 10),
  - **Epoch 002**: Booster, starting at Visit 5 (Month 13-16) and ending at Visit 6 (Month 14-17).
- Study groups: The study groups are presented in Synopsis Table 1.

Synopsis Table 1 Study groups and epochs foreseen in the study

Study groups	Number of subjects	Age (Min/Max) at Visit 1	Epochs	
			Epoch 001	Epoch 002

Protocol Amendment 2 Final Version 02

– **Pedia Group:** Subjects in this group will receive three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

– **Penta Group**: Subjects in this group will receive three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

*Subjects in the Penta Group who have received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination should not receive *Engerix-B* at 4 months of age (Visit 2).

Epoch 002

– **Hexa Group**: Subjects will receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.

– **Pedia Group**: Subjects will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.

– **Penta Group**: Subjects will receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

The fourth dose of pneumococcal conjugate vaccine is recommended to be administered at approximately 12-15 months of age. Since the booster dose of the candidate vaccine/active controls will be given in this study at 15-18 months of age, the fourth dose of *Prevnar13* will not be administered as part of the study protocol. Subject's parent(s)/Legally Acceptable Representative(s) (LARs) will be reminded at Visit 3 and Visit 4 to consult their primary health care provider regarding the fourth dose of *Prevnar13* at 12-15 months for their child.

As the analyses will be performed regardless of the lot of *Infanrix hexa* received, unless otherwise specified, the Hexa_1, Hexa_2 and Hexa_3 groups will be pooled together for the analysis and will be called the Hexa group.

- Treatment allocation: The subjects will be randomized at a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. This will be done at study entry using GSK Biologicals' central randomization system on internet (SBIR).
- Blinding: The study is open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered. However, the

laboratory in charge of the serology testing will be blinded to the treatment, and codes will be used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

The blinding of study epochs is presented in Synopsis Table 3.

Synopsis Table 3 Blinding of study epochs

Study Epochs	Blinding
Epoch 001	open
Epoch 002	open

- Sampling schedule: Blood samples will be drawn from all subjects at the following time points:
  - Post-Pri (Visit 4): One month after the third dose of primary vaccination, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Pre-Bst (Visit 5): Before the administration of the booster dose, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Post-Bst (Visit 6): One month after the booster vaccination, a volume of at least 3.5 mL of whole blood (to provide at least 1.2 mL of serum) will be collected.
- Type of study: self-contained.
- Data collection: electronic Case Report Form (eCRF).

Number of subjects The total number of subjects planned to be enrolled is 585 subjects (65 each in Hexa_1, Hexa_2, Hexa_3 groups and 195 each in Pedia and Penta groups).

Endpoints **Primary**

Epoch 001 (Primary vaccination)

- Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.

Secondary

Epoch 001 (Primary vaccination)

- Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa, Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*.
  - Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3 and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after each vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after each vaccination, according to the **Med**ical **D**ictionary for **R**egulatory **A**ctivities (MedDRA) classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.

- Serious adverse events.
  - Occurrence of serious adverse events from Day 0 up to six months post primary vaccination.

Epoch 002 (Booster vaccination)

- Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Infanrix*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix*.
  - Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4).

- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after booster vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after booster vaccination, according to the MedDRA classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from the booster dose up to one month after the booster vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from the booster dose up to one month after the booster vaccination.

GLOSSARY OF TERMS

Adverse event: Any untoward medical occurrence in a patient or clinical investigation subject, temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product.

An adverse event (AE) can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a medicinal product. For marketed medicinal products, this also includes failure to produce expected benefits (i.e. lack of efficacy), abuse or misuse.

Blinding: A procedure in which one or more parties to the trial are kept unaware of the treatment assignment in order to reduce the risk of biased study outcomes. The level of blinding is maintained throughout the conduct of the trial, and only when the data are cleaned to an acceptable level of quality will appropriate personnel be unblinded or when required in case of a serious adverse event. In an open-label study, no blind is used. Both the investigator and the subject know the identity of the treatment assigned.

Child in care: A child who has been placed under the control or protection of an agency, organization, institution or entity by the courts, the government or a government body, acting in accordance with powers conferred on them by law or regulation. The definition of a child in care can include a child cared for by foster parents or living in a care home or institution, provided that the arrangement falls within the definition above. The definition of a child in care does not include a child who is adopted or has an appointed legal guardian.

Eligible: Qualified for enrolment into the study based upon strict adherence to inclusion/exclusion criteria.

Epoch: An epoch is a self-contained set of consecutive timepoints or a single timepoint from a single protocol. Self-contained means that data collected for all subjects at all timepoints within that epoch allows to draw a complete conclusion to define or precise the targeted label of the product. Typical examples of epochs are primary vaccinations, boosters, yearly immunogenicity follow-ups, and surveillance periods for efficacy or safety.

eTrack:	GSK's tracking tool for clinical trials.
Evaluable:	Meeting all eligibility criteria, complying with the procedures defined in the protocol, and, therefore, included in the according-to-protocol (ATP) analysis (see Sections 6.7.2 and 10.4 for details on criteria for evaluability).
Immunological correlate of protection:	The defined humoral antibody response above which there is a high likelihood of protection in the absence of any host factors that might increase susceptibility to the infectious agent.
Intercurrent medical condition:	A condition that has the capability of altering a subject's immune response or are confirmed to have an immunodeficiency condition during the study.
Investigational vaccine/product: **(Synonym of Investigational Medicinal Product)**	A pharmaceutical form of an active ingredient or placebo being tested or used as a reference in a clinical trial, including a product with a marketing authorization when used in a way different from the approved form, or when used for an unapproved indication, or when used to gain further information about an approved use.
Primary completion date:	The date that the final subject was examined or received an intervention for the purpose of final collection of data for the primary outcome, whether the clinical trial concluded according to the pre-specified protocol or was terminated.
Randomization:	Process of random attribution of treatment to subjects in order to reduce bias of selection.
Self-contained study:	Study with objectives not linked to the data of another study.
Site Monitor:	An individual assigned by the sponsor who is responsible for assuring proper conduct of clinical studies at one or more investigational sites.
Solicited adverse event:	AEs to be recorded as endpoints in the clinical study. The presence/occurrence/intensity of these events is actively solicited from the subject or an observer during a specified post-vaccination follow-up period.

CONFIDENTIAL

Subject:	Term used throughout the protocol to denote an individual who has been contacted in order to participate or participates in the clinical study, either as a recipient of the vaccines or as a control.
Subject number:	A unique number identifying a subject, assigned to each subject consenting to participate in the study.
Treatment:	Term used throughout the clinical study to denote a set of investigational product(s) or marketed product(s) or placebo intended to be administered to a subject, identified by a unique number, according to the study randomization or treatment allocation.
Treatment number:	A number identifying a treatment to a subject, according to the study randomization or treatment allocation.
Unsolicited adverse event:	Any AE reported in addition to those solicited during the clinical study. Also any 'solicited' symptom with onset outside the specified period of follow-up for solicited symptoms will be reported as an unsolicited adverse event.

TRADEMARKS

The following trademarks are used in the present protocol.

In the body of the protocol (including the synopsis), the names of the vaccines will be written without the superscript symbol ™ or ® and in *italics*.

Trademarks of the GlaxoSmithKline group of companies	Generic description
Engerix-B®	Hepatitis B vaccine (recombinant)
Hiberix™	*Haemophilus* b conjugate vaccine (tetanus toxoid conjugate)
Infanrix®	Diphtheria and Tetanus Toxoids and Acellular Pertussis Vaccine Adsorbed
Infanrix hexa™	Combined Diphtheria-Tetanus-acellular Pertussis (DTaP), Hepatitis B, Poliovirus and *Haemophilus influenzae* type b vaccine
Pediarix®	Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed, Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine
Rotarix®	Rotavirus Vaccine, Live, Oral

Trademarks not owned by the GlaxoSmithKline group of companies	Generic description
ActHIB® **(Sanofi Pasteur SA)**	*Haemophilus* type b conjugate vaccine (tetanus toxoid conjugate)
Pentacel® **(Sanofi Pasteur SA)**	Diphtheria and tetanus toxoids and acellular pertussis adsorbed, inactivated poliovirus and *Haemophilus* b conjugate (tetanus toxoid conjugate)
Prevnar® **(Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.)**	Pneumoccocal 7-valent conjugate vaccine (diphtheria CRM_{197} protein)
Prevnar13® **(Wyeth Pharmaceuticals Inc.; Marketed by Pfizer Inc.)**	Pneumoccocal 13-valent conjugate vaccine (diphtheria CRM_{197} protein)

1. INTRODUCTION

1.1. Background

Combination vaccines have been developed to provide multiple immunizations in a single injection. They can simplify vaccine administration and have the potential to promote compliance and cost-effectiveness by decreasing the number of injections needed to immunize a child [Zinke, 2010; Kalies, 2006]. Use of combination vaccines can alleviate concerns associated with the number of injections to be given at one time [ACIP, 2011].

GlaxoSmithKline (GSK) Biologicals' *Infanrix hexa* vaccine helps prevent six diseases in a single injection. *Infanrix hexa* is licensed for primary and booster vaccination in more than 98 countries around the globe, including the entire European Union. The vaccine complies with the WHO requirements for manufacture of biological substances for all of its antigenic components. The *Infanrix hexa* vaccine consists of a combination of GSK's *Pediarix* (Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed, Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine Combined); STN 103907, approved in the United States (US) on December 13, 2002 and a Hib vaccine consisting of purified polyribosyl-ribitol-phosphate (PRP) capsular polysaccharide of *Haemophilus influenzae* type b covalently bound to tetanus toxoid (TT). The conjugated Hib-TT is the same as that used for the formulation of *Hiberix* [*Haemophilus* b Conjugate Vaccine (Tetanus Toxoid Conjugate)] (licensed in the US as a booster dose in August 2009), with the only difference that in *Infanrix hexa*, the Hib-conjugate is adsorbed onto aluminum phosphate.

The *Infanrix hexa* combination vaccine would provide an additional source of DTaP, hepatitis B, poliovirus, and Hib containing vaccines for the US market and would potentially reduce the number of injections required to provide infants with recommended vaccinations.

GSK has an extensive clinical safety database for *Infanrix hexa*. The safety and immunogenicity data of the vaccine have been evaluated in numerous controlled studies [Dhillon, 2010; Zepp, 2009], of which 4 were conducted in the US with approximately 3000 US subjects exposed to a primary vaccination with *Infanrix hexa*.

Please refer to the current Investigator Brochure for information regarding the pre-clinical and clinical studies and the potential risks and benefits of *Infanrix hexa*.

1.2. Rationale for the study and study design

1.2.1. Rationale for the study

Infanrix hexa was first licensed in the European Union in 2000. More than 100 million doses have been distributed to date and the benefit/risk profile remains favorable. Licensure of *Infanrix hexa* combination vaccine in the US will provide an additional option for vaccination within the routine US pediatric schedule with the fewest number of injections, which would create opportunities to add further injections in case other novel vaccines against important pediatric diseases become available. Furthermore, *Infanrix hexa* will provide an additional source of DTaP, hepatitis B, poliovirus, and Hib-containing vaccine to the US market, which will help ensure a more stable supply.

The present study 117119 (DTPA-HBV-IPV-135) is intended to generate pivotal immunogenicity data demonstrating non-inferiority of the immune responses against pertussis antigens of *Infanrix hexa* compared to *Pediarix,* which is currently one of the DTaP combination vaccines widely used as a standard of care in the US. Additionally, this study will also provide descriptive data with regard to the immunogenicity of the other vaccine antigens and the safety profile in US subjects. These pivotal immunogenicity non-inferiority data for pertussis and descriptive safety data are intended to support the registration of GSK Biologicals' combined DTPa-HBV-IPV/Hib (*Infanrix hexa*) vaccine in the US. A subsequent Phase III study is planned to provide pivotal data regarding lot-to-lot consistency, safety and the immunogenicity of the other vaccine antigens.

Comparison of immunogenicity data from separate clinical studies for *Infanrix hexa* and *Pentacel*, given on a 2-4-6 month schedule, suggests that the immune response to the Hib component of these vaccines is similar. This study will provide descriptive information regarding the immune response to the Hib components of *Infanrix hexa* and *Pentacel* following a 3-dose primary series, prior to further evaluation in Phase III studies.

1.2.2. Rationale for the study design

1.2.2.1. Design of Epoch 001 (primary vaccination):

The study is designed as a randomized, controlled, open-label study with five parallel groups:

- The first three groups (Hexa_1, Hexa_2 and Hexa_3 group) will receive three doses of the *Infanrix hexa* vaccine (either lot A, lot B or lot C, respectively). These three groups will be pooled together for the analyses and the pooled group will be called the Hexa group.
- The Pedia Group (Control 1) will receive three doses of the US-licensed control vaccines, *Pediarix* and *ActHIB*.
- The Penta Group (Control 2) will receive three doses of the US-licensed control vaccines, *Pentacel* (only two doses of *Engerix-B* will be administered if a subject has received a birth dose of hepatitis B vaccine).

Three distinct vaccine lots manufactured according to the same procedures will be used in the Hexa group in order to obtain more representative data for the vaccine.

The study will be open-label due to the differences in the number of injections and the appearance of the vaccines administered.

Vaccines (i.e., *Prevnar13* and *Rotarix*) that are recommended for children in the US during the first year of life will be administered concomitantly with the other study vaccines as part of the study.

1.2.2.2. Design of Epoch 002 (booster vaccination):

In Epoch 002, the subjects will be assessed for antibody persistence to the vaccine antigens of *Infanrix hexa*. This epoch will also assess the adequacy of priming subjects with *Infanrix hexa* by evaluating the boostability of D, T, Pa and Hib antigens with the US-licensed vaccines. The pooled Hexa Group will receive booster doses of *Infanrix* and *Hiberix* vaccines at 15 through 18 months of age, the subjects in the Penta Group will receive *Pentacel* vaccine as a booster, and the subjects in the Pedia Group will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15 through 18 months of age.

The study will continue to be open-label in Epoch 002.

2. OBJECTIVES

2.1. Primary objective

2.1.1. Epoch 001 (Primary vaccination)

- To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens [pertussis toxoid (PT), filamentous hemagglutinin (FHA) and pertactin (PRN)] one month after the third dose of the primary vaccination.

  Criteria for non-inferiority:

  Non-inferiority in terms of immune response to pertussis antigens will be demonstrated if, for each of the three antigens, the upper limit of the 95% confidence interval (CI) on the GMC ratio [Pedia divided by Hexa] is ≤ 1.5.

Refer to Section 10.1 for the definition of the primary endpoint.

2.2. Secondary objectives

2.2.1. Epoch 001 (Primary vaccination)

- To assess the immune response to *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to D, T, HBs, pertussis, poliovirus types 1, 2 and 3 and PRP antigens, one month after the third dose of the primary vaccination.

CONFIDENTIAL

- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa,* of *Pentacel* co-administered with *Engerix-B,* and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events, new-onset chronic diseases (NOCDs) and serious adverse events.

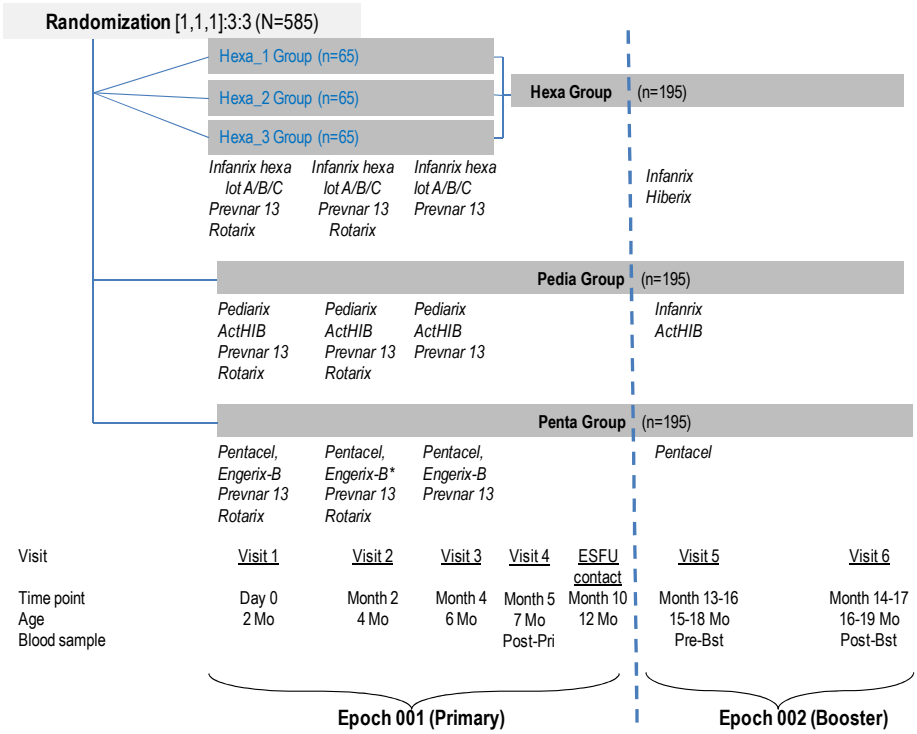
2.2.2. Epoch 002 (Booster vaccination)

- To assess the immunogenicity of *Infanrix hexa, Pentacel, Engerix-B, Pediarix* and *ActHIB,* in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.
- To assess the immune response to *Infanrix, Hiberix, ActHIB* and *Pentacel,* in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix and Pentacel*, one month after the booster dose.
- To assess the safety and reactogenicity of booster doses of *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*.

Refer to Section 10.2 for the definition of the secondary endpoints.

CONFIDENTIAL

3. STUDY DESIGN OVERVIEW



N = number of subjects in the study; n = number of subjects in each group; Mo = months
Visit 3 should be conducted at least 8 weeks after Visit 2, with subjects at least 24 weeks of age, in order to comply with US recommendations on hepatitis B dosing
Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002
* *Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group
ESFU = Extended safety follow-up

Protocol waivers or exemptions are not allowed with the exception of immediate safety concerns. Therefore, adherence to the study design requirements, including those specified in the outline of study procedures (Section 5.5), are essential and required for study conduct.

- Experimental design: Phase III, open-label, randomized, controlled, multi-centric, single-country study with five parallel groups.
- Duration of the study: The intended duration of the study per subject is approximately 14-17 months.
  - **Epoch 001:** Primary, starting at Visit 1 (Day 0) and ending at safety follow up contact (i.e. six months following the third dose, Month 10),

CONFIDENTIAL

- **Epoch 002:** Booster, starting at Visit 5 (Month 13-16) and ending at Visit 6 (Month 14-17).

- Study groups: The study groups and epochs foreseen in the study are presented in Table 1.

Table 1 Study groups and epochs foreseen in the study

Study groups	Number of subjects	Age (Min/Max) at Visit 1	Epochs	
			Epoch 001	Epoch 002
Hexa_1	65	6 WEEK -12weeks	x	x
Hexa_2	65	6 WEEK -12weeks	x	x
Hexa_3	65	6 WEEK -12weeks	x	x
Pedia	195	6 WEEK -12weeks	x	x
Penta	195	6 WEEK -12weeks	x	x

The study groups and treatment foreseen in the study are presented in Table 2.

Table 2 Study groups and treatment foreseen in the study

Treatment name	Vaccine/Product name	Study Groups				
		Hexa_1	Hexa_2	Hexa_3	Pedia	Penta
Epoch 001						
Infanrix hexa		x	x	x		
	Hib					
Pediarix					x	
ActHIB	ActHIB				x	
	NaCl					
Pentacel	DTaP-IPV (Sanofi Pasteur)					x
	ActHIB					
Engerix-B*	HBV					x
Prevnar13	Prevenar 13	x	x	x	x	x
Rotarix	HRV	x	x	x	x	x
	$CaCO_3$					
Epoch 002						
Infanrix	DTPa	x	x	x	x	
Hiberix	Hib	x	x	x		
	NaCl					
ActHIB	ActHIB				x	
	NaCl					
Pentacel	DTaP-IPV (Sanofi Pasteur)					x
	ActHIB					

** Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group.

- Control: active controls.
  - Epoch 001: *Pediarix* + *ActHIB* and *Pentacel* + *Engerix-B*
  - Epoch 002: *Infanrix* + *ActHIB* and *Pentacel*.

CONFIDENTIAL

Vaccination schedules:

Epoch 001

- **Hexa Group:** Subjects in this group will receive three doses of *Infanrix hexa* (lot A, lot B or lot C as per the group allocation) co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
  - Hexa_1 Group: Subjects will receive lot A of *Infanrix hexa,*
  - Hexa_2 Group: Subjects will receive lot B of *Infanrix hexa*
  - Hexa_3 Group: Subjects will receive lot C of *Infanrix hexa*.
- **Pedia Group:** Subjects in this group will receive three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
- **Penta Group**: Subjects in this group will receive three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

*Subjects in the Penta Group who have received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination should not receive *Engerix-B* at 4 months of age (Visit 2).

Epoch 002

- **Hexa Group**: Subjects will receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.
- **Pedia Group**: Subjects will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.
- **Penta Group**: Subjects will receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

The fourth dose of pneumococcal conjugate vaccine is recommended to be administered at approximately 12-15 months of age. Since the booster dose of the candidate vaccine/active controls will be given in this study at 15-18 months of age, the fourth dose of *Prevnar13* will not be administered as part of the study protocol. Subject's parent(s)/Legally Acceptable Representative(s) (LARs) will be reminded at Visit 3 and Visit 4 to consult their primary health care provider regarding the fourth dose of *Prevnar13* at 12-15 months for their child.

- As the analyses will be performed regardless of the lot of *Infanrix hexa* received, unless otherwise specified, the Hexa_1, Hexa_2 and Hexa_3 groups will be pooled together for the analysis and will be called the Hexa group.

- Treatment allocation: The subjects will be randomized at a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. This will be done at study entry using GSK Biologicals' central randomization system on internet (SBIR).

- Blinding: The study is open-label for both epochs (Table 3) due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing will be blinded to the treatment, and

codes will be used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

The blinding of study epochs is presented in Table 3.

Table 3 Blinding of study epochs

Study Epochs	Blinding
Epoch 001	open
Epoch 002	open

- Sampling schedule: Blood samples will be drawn from all subjects at the following time points:
  - Post-Pri (Visit 4): One month after the third dose of primary vaccination, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Pre-Bst (Visit 5): Before the administration of the booster dose, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Post-Bst (Visit 6): One month after the booster vaccination, a volume of at least 3.5 mL of whole blood (to provide at least 1.2 mL of serum) will be collected.
- Type of study: self-contained.
- Data collection: electronic Case Report Form (eCRF).

4. STUDY COHORT

4.1. Number of subjects/centers

Target enrolment will be 585 subjects (65 each in Hexa_1, Hexa_2, Hexa_3 groups and 195 each in Pedia and Penta groups). Enrolment will be terminated when the target number of subjects has been enrolled. Refer to Section 10.3 for a detailed description of the criteria used in the estimation of sample size.

This study will be conducted at multiple centers in the US.

Actual numbers of subjects enrolled versus target will be monitored by the site monitor using SBIR.

4.2. Inclusion criteria for enrolment

Deviations from inclusion criteria are not allowed because they can potentially jeopardize the scientific integrity of the study, regulatory acceptability or subject safety. Therefore, adherence to the criteria as specified in the protocol is essential.

All subjects must satisfy ALL the following criteria at study entry:

- Subjects' parent(s)/ LAR(s) who, in the opinion of the investigator, can and will comply, with the requirements of the protocol (e.g. completion of the diary cards, return for follow-up visits).
- A male or female between, and including, 6 and 12 weeks of age at the time of the first vaccination.
- Born full-term (i.e. after a gestation period of 37 weeks to less than 42 completed weeks [259 to 293 days]).
- Written informed consent obtained from parent(s)/LAR(s) of the subject.
- Healthy subjects as established by medical history and clinical examination before entering into the study.
- Infants who have not received a previous dose of hepatitis B vaccine or those who have received only 1 dose of hepatitis B vaccine administered at least 30 days prior to enrolment.

4.3. Exclusion criteria for enrolment

Deviations from exclusion criteria are not allowed because they can potentially jeopardize the scientific integrity of the study, regulatory acceptability or subject safety. Therefore, adherence to the criteria as specified in the protocol is essential.

The following criteria should be checked at the time of study entry. If ANY exclusion criterion applies, the subject must not be included in the study:

- Child in care

  Please refer to the glossary of terms for the definition of child in care.
- Use of any investigational or non-registered product (drug or vaccine) other than the study vaccines within 30 days preceding the first dose of study vaccines, or planned use during the study period.
- Chronic administration (defined as more than 14 days in total) of immunosuppressants or other immune-modifying drugs since birth. For corticosteroids, this will mean prednisone ≥ 0.5 mg/kg/day, or equivalent. Inhaled and topical steroids are allowed.
- Planned administration/administration of a vaccine not foreseen by the study protocol within the period starting from 30 days before the first vaccination until 30 days after Dose 3 (Epoch 001, primary vaccination) and from 30 days before the booster Dose 4 until 30 days after booster Dose 4 (Epoch 002, booster vaccination), i.e. the end of the study:
  - Inactivated influenza and hepatitis A vaccines are allowed throughout the study.
  - Routine administration(s) of vaccines are allowed from 30 days after the last dose of primary vaccination until 30 days before the booster dose and after post-booster blood sampling. Routine administration of measles-mumps-rubella

CONFIDENTIAL

vaccine, varicella, pneumococcal vaccines are allowed from 30 days after last dose of primary vaccine until 30 days before booster dose and from post-booster blood sampling, as well as according to the recommended immunization schedule in US.

- Concurrently participating in another clinical study, at any time during the study period, in which the subject has been or will be exposed to an investigational or a non-investigational product (pharmaceutical product or device).
- History of Hib, diphtheria, tetanus, pertussis, pneumococcal, rotavirus, poliovirus and hepatitis B diseases.
- Previous vaccination against Hib, diphtheria, tetanus, pertussis, pneumococcus, rotavirus and/or poliovirus; more than one previous dose of hepatitis B vaccine.
- Any confirmed or suspected immunosuppressive or immunodeficient condition, based on medical history and physical examination (no laboratory testing required).
- Family history of congenital or hereditary immunodeficiency.
- History of any reaction or hypersensitivity likely to be exacerbated by any component of the vaccines (including yeast).
- Hypersensitivity to latex.
- Major congenital defects or serious chronic illness.
- History of any neurological disorders including seizures.
- Administration of immunoglobulins and/or any blood products since birth or planned administration during the study period.
- History of intussusception or of any uncorrected congenital malformation of the gastrointestinal tract that would predispose the infant to intussusception.
- History of Severe Combined Immunodeficiency Disease (SCID).
- Acute disease and/or fever at the time of enrolment.
  - Fever is defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002.
  - Subjects with a minor illness (such as mild diarrhea, mild upper respiratory infection) without fever may, be enrolled at the discretion of the investigator.

5. CONDUCT OF THE STUDY

5.1. Regulatory and ethical considerations, including the informed consent process

The study will be conducted in accordance with all applicable regulatory requirements.

The study will be conducted in accordance with the ICH Guideline for Good Clinical Practice (GCP), all applicable subject privacy requirements and the guiding principles of the Declaration of Helsinki.

The study has been designed and will be conducted in accordance with the ICH Harmonised Tripartite Guideline for clinical investigation of medicinal products in the paediatric population (ICH E11) and all other applicable ethical guidelines.

GSK will obtain favorable opinion/approval to conduct the study from the appropriate regulatory agency, in accordance with applicable regulatory requirements, prior to a site initiating the study in that country.

Conduct of the study includes, but is not limited to, the following:

- Institutional Review Board (IRB)/Independent Ethics Committee (IEC) review and favorable opinion/approval of study protocol and any subsequent amendments.
- Subject's parent(s)/LAR(s) informed consent.
- Investigator reporting requirements as stated in the protocol.

GSK will provide full details of the above procedures to the investigator, either verbally, in writing, or both.

Freely given and written informed consent must be obtained from each subject's parent(s)/LAR(s) prior to participation in the study.

GSK Biologicals will prepare a model Informed Consent Form (ICF) which will embody the ICH GCP and GSK Biologicals required elements. While it is strongly recommended that this model ICF is to be followed as closely as possible, the informed consent requirements given in this document are not intended to pre-empt any local regulations which require additional information to be disclosed for informed consent to be legally effective. Clinical judgement, local regulations and requirements should guide the final structure and content of the local version of the ICF.

The investigator has the final responsibility for the final presentation of the ICF, respecting the mandatory requirements of local regulations. The ICF generated by the investigator with the assistance of the sponsor's representative must be acceptable to GSK Biologicals and be approved (along with the protocol, and any other necessary documentation) by the IRB/IEC.

5.2. Subject identification and randomization of treatment

5.2.1. Subject identification

After checking the inclusion/exclusion criteria, subject numbers will be assigned sequentially to subjects whose parent(s)/LAR(s) give consent for their child to participate in the study, according to the range of subject numbers allocated to each study center. Subject numbers will also be used to identify blood samples collected during the study.

5.2.2. Randomization of treatment

5.2.2.1. Randomization of supplies

The numbering of supplies will be performed at GSK Biologicals, using MATerial EXcellence (MATEX), a program developed for use in Statistical Analysis System (SAS®) (Cary, NC, USA) by GSK Biologicals.

To allow GSK Biologicals to take advantage of greater rates of recruitment than anticipated at individual centers in this multi-center study and to thus reduce the overall study recruitment period, an over-randomization of supplies will be prepared.

5.2.2.1.1. Epoch 001

A first list based on a randomization blocking scheme using a [1:1:1]:3:3 randomization ratio will be used to number the following vaccines for Doses 1, 2 and 3.

- DTPa-HBV-IPV/Hib lot A
- DTPa-HBV-IPV/Hib lot B
- DTPa-HBV-IPV/Hib lot C
- *Pediarix*
- *Pentacel*

The vaccines from this list will be distributed to the study center while respecting the randomization block size.

ActHIB, Engerix-B, Prevnar13 and *Rotarix* will be numbered independently using a sequential numbering.

5.2.2.1.2. Epoch 002

Four sequential lists (one for *Infanrix*, one for *Hiberix*, one for *ActHIB* and one for *Pentacel*) will be used to number the vaccine doses for the Epoch 002.

The study staff in charge of the vaccine administration will access SBIR, provide the subject identification number and the dose number. The system will provide a new treatment number for all the vaccines to be administered to a subject (*Pentacel, Infanrix* + *ActHIB* or *Infanrix* + *Hiberix*). This will be consistent with the allocated study group.

5.2.2.2. Treatment allocation to the subject

The treatment numbers will be allocated by dose.

5.2.2.2.1. Study group and treatment number allocation

The target is to enroll 585 subjects to be randomly assigned to five study groups in a [1:1:1]:3:3 ratio (195 subjects in the pooled lots group).

Allocation of the subject to a study group at the investigator site will be performed using SBIR. The randomization algorithm will use a minimization procedure accounting for the study as a whole and each of the centers.

After obtaining the signed and dated ICF from the subject's parent(s)/LAR(s) and having checked the eligibility of the subject, the site staff in charge of the vaccine administration will access SBIR. Upon providing the subject identification number, the randomization system will ask whether the subject had a previous hepatitis B vaccination and will use the minimization algorithm to determine the group allocation and the appropriate treatment number for *Pentacel*, *Pediarix* or for *Infanrix hexa* (lot A, lot B or lot C) to be used for the subject.

SBIR will also provide treatment numbers for co-administered vaccines *Engerix B, ActHib, Prevnar13* vaccine and a *Rotarix* vaccine, each one labelled with a different treatment number. Therefore a subject will have three or four different treatment numbers allocated at dose 1.

The number of each administered treatment must be recorded in the eCRF on the Vaccine Administration screen.

When SBIR is not available, please refer to the SBIR user guide or the Study Procedures Manual (SPM) for specific instructions.

5.2.2.2.2. Treatment number allocation for subsequent doses

For each dose subsequent to the first dose, the study staff in charge of the vaccine administration will access SBIR, provide the subject identification number, the dose number and the system will provide new treatment numbers consistent with the allocated study group.

Each vaccine will be labeled with a different treatment number.

The number of each administered treatment must be recorded in the eCRF on the Vaccine Administration screen.

Note that in the Penta Group, the investigator will be reminded that *Engerix-B* is not allowed at dose 2 for subjects with previous hepatitis B vaccination. So for these subjects, the treatment identified by SBIR for dose 2 should not be used.

5.3. Method of blinding

The study will be open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing will be blinded to the treatment, and codes will be used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.

5.4. General study aspects

Supplementary study conduct information not mandated to be present in this protocol is provided in the accompanying SPM. The SPM provides the investigator and the site personnel with administrative and detailed technical information that does not impact the safety of the subjects.

5.5. Outline of study procedures

The outline of study procedures is presented in Table 4.

.

It is the investigator's responsibility to ensure that intervals between visits are strictly followed. The intervals between study visits are presented in Table 5.

Table 5 Intervals between study visits

Interval	Optimal length of interval[1]
Birth→Visit 1	6-12 weeks (42-90 days) of age[2]
Visit 1 →Visit 2	49-83 days[2]
Visit 2 →Visit 3 *	56-90 days[2]
Visit 3 → Visit 4	30-48 days[2] †
Visit 3 → Phone call (ESFU contact)	180-210 days**
Birth→ Visit 5^	15-18 months of age[2]
Visit 5 → Visit 6	30-48 days[2] †

[1] Whenever possible the investigator should arrange within this interval;
[2] Subjects may not be eligible for inclusion in one or more cohorts for analysis if they make the study visit outside this interval. For Visit 3-Visit 4 and Visit 5-Visit 6, an interval of 21-48 days will be considered for the According-to-protocol (ATP) cohort of immunogenicity. Refer to Section 10.4 for the definition of the cohorts for analysis;
* Advisory Committee on Immunization Practices (ACIP) recommendation states that minimum age of last Hep B dose is 24 weeks and this last dose should be administered at least 8 weeks after the previous dose. So, Visit 3 should be conducted at least 8 weeks after Visit 2 and when the subject is at least 24 weeks of age
† It is preferred that subjects come in for Visit 4 and Visit 6, at least 30 days after Visits 3 and 5, respectively. If subjects return for the visit prior to 30 days, they should take home the diary card and continue to record unsolicited safety information until 30 days post-vaccination and mail/send it upon completion. Investigators will make an attempt to retrieve diary cards from subjects who have not mailed/sent them in.
^ Visit 5 should occur after the ESFU. ESFU must occur prior to vaccination if Visit 5 coincides with the 6 months post-Visit 3 time-point
** Adherence to the interval pertaining to phone contact is only indicative and will not determine a subject's eligibility for inclusion for ATP analysis. However, the interval should be respected in order to obtain safety information over the complete 6 months extended safety follow up period.

5.6. Detailed description of study procedures

5.6.1. Procedures prior to study participation

5.6.1.1. Informed consent

The signed informed consent of the subject's parent(s)/LAR(s) must be obtained before study participation.

5.6.2. Procedures during the study

5.6.2.1. Check inclusion and exclusion criteria

Check all inclusion and exclusion criteria as described in Sections 4.2 and 4.3 before enrolment.

5.6.2.2. Collect demographic data

Record demographic data such as date of birth, gender, geographic ancestry and ethnicity in the subject's eCRF.

5.6.2.3. Medical history

Obtain the subject's medical history by interview and/or review of the subject's medical records and record any pre-existing conditions or signs and/or symptoms present in a subject prior to the first study vaccination in the eCRF.

5.6.2.4. Vaccination history

Obtain the subject's vaccination history by interview and/or review of the subject's medical records and record any vaccinations given to the subject, including hepatitis B vaccines, prior to the first study vaccination in the eCRF. The Tdap vaccination history of the mother during pregnancy will also be collected and recorded in the eCRF (provided that the mother has consented to provide this information).

Note: Maternal vaccination is requested in order to be able to summarize the responses of the subjects to pertussis antigens according to whether or not the mothers received a pertussis vaccine during their pregnancy. This information will aid in understanding the effect of transplacentally transferred antibodies on the childs' immune response to vaccination.

5.6.2.5. History directed physical examination

Perform a history directed physical examination at Visit 1 (Epoch 001) and Visit 5 (Epoch 002). If the investigator determines that the subject's health on the day of vaccination temporarily precludes vaccination, the visit will be rescheduled. Collected information, including length and weight, needs to be recorded in the eCRF.

Treatment of any abnormality observed during this examination has to be performed according to local medical practice outside this study or by referral to an appropriate health care provider.

5.6.2.6. Study group and treatment number allocation

Study group and treatment number allocation will be performed as described in Section 5.2.2. The number of each administered treatment must be recorded in the eCRF.

5.6.2.7. Treatment number allocation for subsequent doses

The treatment number allocation for subsequent doses will be performed at Visits 2, 3 and 5 as described in Section 5.2.2. The number of each administered treatment must be recorded in the eCRF.

5.6.2.8. Assess pre-vaccination body temperature

The axillary, rectal, oral or tympanic body temperature of all subjects needs to be measured prior to the study vaccine administration at Visits 1, 2, 3 and 5. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002. If the subject has fever [fever is defined as temperature ≥38.0°C /100.4°F by any route] on the day of vaccination, the vaccination visit will be rescheduled within the allowed interval for this visit (see Table 5).

CONFIDENTIAL

5.6.2.9. Sampling

Refer to the Module on Biospecimen Management in the SPM for detailed instructions for the collection, handling and processing of the samples.

5.6.2.9.1. Blood sampling for immune response assessments

Blood samples will be taken during certain study visits as specified in Section 5.5 List of Study Procedures.

- A volume of approximately 5.0 mL of whole blood to provide approximately 1.7 mL of serum should be drawn from all subjects for the analysis of humoral immune response at Visits 4 and 5. At least 3.5 mL of whole blood to provide approximately 1.2 mL of serum should be drawn from all subjects for the analysis of humoral immune response at Visit 6. After centrifugation, serum samples should be kept at –20°C/ –4°F or below until shipment. Refer to the SPM for more details on sample storage conditions.

5.6.2.10. Check contraindications, warnings and precautions to vaccination

Contraindications, warnings and precautions to vaccination must be checked at the beginning of each vaccination visit. Refer to Sections 6.5 and 6.6 for more details.

5.6.2.11. Baseline measurement of limb circumference after booster vaccination at visit 5

(Amendment 2: 17 April 2015)

During Epoch 002, baseline measurement of limb circumference (arms or legs according to where the vaccine was administered) at the level of the injection site should be obtained. For the Penta group, baseline measurement is only required for the limb that will be vaccinated. Clothing should be removed so as not to interfere with the measurement of the limb circumference. For measuring upper arm circumference, the measurement will be performed while the arm is held parallel to the trunk and the elbow is flexed in front at 90° (as if the subject is carrying a tray) [Kohl, 2007]. For measuring leg circumference the child should be standing or lying flat, as appropriate, as long as the leg is straight.

5.6.2.12. Study Vaccines administration

- After completing all prerequisite procedures prior to vaccination, one dose of study vaccine/control vaccines will be administered intramuscularly (IM) (refer to Section 6.3 for detailed description of the vaccines administration procedure). If the investigator or delegate determines that the subject's health on the day of administration temporarily precludes vaccine administration, the visit will be rescheduled within the allowed interval for this visit (refer to Table 5).

- The subjects will be observed closely for at least 30 minutes following the administration of the vaccines, with appropriate medical treatment readily available in case of anaphylaxis.

5.6.2.13. Recording of AEs, SAEs and NOCDs

(Amendment 2: 17 April 2015)

- Refer to Section 8.3 for procedures for the investigator to record AEs, SAEs and NOCDs. NOCDs include events such as autoimmune disorders, asthma, type I diabetes and allergies. Refer to Section 8.4 for guidelines on how to submit SAE reports to GSK Biologicals.

The subjects' parent(s)/LAR(s) will be instructed to contact the investigator immediately should the subjects manifest any signs or symptoms they perceive as serious.

- At each vaccination visit, diary cards will be provided to the subject's parent(s)/LAR(s). The subject's parent(s)/LAR(s) will record body (rectal for subjects in Epoch 001 and axillary for subjects in Epoch 002) temperature and any solicited local/general AEs (i.e. on the day of vaccination and during the next 3 days) or any unsolicited AEs (i.e. on the day of vaccination and during the next 30 days occurring after vaccination). The subject's parent(s)/LAR(s) will be instructed to return the completed diary card to the investigator at the next study visit.
- Collect and verify completed diary cards during discussion with the subject's parent(s)/LAR(s) on Visits 2, 3, 4 and 6.
- During Epoch 002, following the fourth dose vaccination, the parents/LAR(s) should be provided with a measurement device for recording circumference of injected limbs (arms or legs according to where vaccine was administered) at the level of the injection site on the day of vaccination and during the next three days on a diary card. The parents/LAR(s) should be instructed on how and where to perform the measurement of the circumference of the vaccinated limb. Daily measurements should be performed in the same manner preferably by the same person and at the same time of day during the 4-day follow-up (Day 0-Day 3) period.
- If the parent(s) /LAR(s) of infants observe any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of limb circumference) during the 4-day follow-up (Day 0-Day 3) period they are to contact study personnel and to visit the investigator's office for evaluation as soon as possible and to bring the diary card with them.

- In addition to the diameter of the swelling and the circumference of the limb that are reported as solicited symptoms, the parent(s)/LAR(s) will record the following additional symptoms/characteristics that may be associated with large injection site swelling reactions on the diary card:
  - Type of swelling (local swelling only around the injection site, diffuse swelling not involving the elbow or knee joint, swelling involving the elbow or knee joint)
  - Induration at injection site (largest diameter)
  - Pruritis at the injection site (intensity – scale provided)
  - Functional impairment (intensity – scale and description provided)
- The study personnel's evaluation will be recorded in the medical chart. In case the diary card score is not in line with the medical chart score, the medical chart will indicate what is the most intense score. The largest or most intense score for a given day will be recorded in the eCRF at the level of the solicited symptoms and at the level of the large swelling report form.
- Any unreturned diary cards will be sought from the subject's parent(s)/LAR(s) through telephone call(s) or any other convenient procedure. The investigator will transcribe the collected information into the eCRF in English.

5.6.2.14. Check and record concomitant medication/vaccination and intercurrent medical conditions

Concomitant medication/vaccination must be checked and recorded in the eCRF as described in Section 6.7.

Intercurrent medical conditions must be checked and recorded in the eCRF as described in Section 6.8.

5.6.2.15. Study conclusion

The investigator will:

- review data collected to ensure accuracy and completeness at ESFU contact and Visit 6
- complete the Study Conclusion screen in the eCRF.

At study completion, post-trial commercial vaccines will not be provided to the subjects.

5.7. Biological sample handling and analysis

Please refer to the SPM for details on biospecimen management (handling, storage and shipment).

Samples will not be labelled with information that directly identifies the subject but will be coded with the identification number for the subject (subject number).

Under the following circumstances, additional testing on the samples may be performed by GSK Biologicals outside the scope of this protocol:

- Collected samples may be used in other assays, for test improvement or development of analytical methods related to the study vaccines and its constituents or the disease under study.
- Collected samples may be used for purposes related to the quality assurance of data generated linked to the study vaccines or the disease under study, such as for maintenance of assays described in this protocol and comparison between analytical methods and/or laboratories.

Information on further investigations and their rationale can be obtained from GSK Biologicals.

Any sample testing will be done in line with the consent of the individual subject's parent(s)/LAR(s).

Refer also to the Investigator Agreement, where it is noted that the investigator cannot perform any other biological assays except those described in the protocol or its amendment(s).

If additional testing is performed, the marker priority ranking given in Section 5.7.4 may be changed.

Collected samples will be stored for a maximum of 20 years (counting from when the last subject performed the last study visit), unless local rules, regulations or guidelines require different timeframes or different procedures, which will then be in line with the subject consent. These extra requirements need to be communicated formally to and discussed and agreed with GSK Biologicals.

5.7.1. Use of specified study materials

When materials are provided by GSK Biologicals, it is MANDATORY that all clinical samples (including serum samples) be collected and stored exclusively using those materials in the appropriate manner. The use of other materials could result in the exclusion of the subject from the ATP analysis (See Section 10.4 for the definition of study cohorts/ data sets to be analysed). The investigator must ensure that his/her personnel and the laboratory(ies) under his/her supervision comply with this requirement. However, when GSK Biologicals does not provide material for collecting and storing clinical samples, appropriate materials from the investigator's site must be used. Refer to the Module on Clinical Trial Supplies in the SPM.

5.7.2. Biological samples

Table 6 Biological samples

Sample type	Quantity*	Unit	Timepoint
Blood	5	mL	Month 5 (Post-Pri)
Blood	5	mL	Month 13-16 (Pre-Bst)
Blood	3.5	mL	Month 14-17 (Post-Bst)

* Approximate quantity
Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002

5.7.3. Laboratory assays

(Amendment 2: 17 April 2015)

Please refer to APPENDIX A for the address of the clinical laboratories used for sample analysis.

At Visits 4, 5 and 6, blood will be collected for measurement of immune response. Total blood volume to be taken from each subject over the study period is approximately 13.5 mL (approximately 5.0 mL of whole blood to provide approximately 1.7 mL of serum at Visits 4 and 5 and at least 3.5 mL of whole blood to provide approximately 1.2 mL of serum at Visit 6). All serology will be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized procedures with adequate controls. ***All serology for primary endpoints will be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized, validated procedures with adequate controls.***

The laboratory assays for humoral immunity are presented in Table 7.

Table 7 Humoral Immunity (Antibody determination)

(Amendment 2: 17 April 2015)

System	Component	Method	Test kit/ Manufacturer	Unit	Cut-off†	Laboratory**
Serum	Bordetella pertussis.Pertussis Toxin Ab.IgG	ELISA	In-house*	EL.U/mL	5	GSK Biologicals§
Serum	Bordetella pertussis.Filamentous Hemaglutinin Ab.IgG	ELISA	In-house*	EL.U/mL	5	GSK Biologicals§
Serum	Bordetella pertussis.Pertactin Ab.IgG	ELISA	In-house*	EL.U/mL	5	GSK Biologicals§
Serum	Corynebacterium diphtheriae.Diphtheria Toxoid Ab.IgG	ELISA	In-house*	IU/mL	0.1	GSK Biologicals§
Serum	Clostridium tetani.Tetanus Toxoid Ab.IgG	ELISA	In-house*	IU/mL	0.1	GSK Biologicals§
Serum	Hepatitis B Virus.Surface Ab	CLIA	Centaur (Siemens Healthcare)	mIU/mL	6.2	GSK Biologicals§
Serum	Poliovirus Sabin Types 1, 2 and 3	NEUTRA	In-house*	ED_{50}	8	GSK Biologicals§
Serum	Haemophilus influenzae type b.Polyribosyl Ribitol Phosphate Ab ‡	ELISA	In-house*	µg/mL	0.15	GSK Biologicals§

*In-house refers to assays developed internally by GSK which can be performed at GSK Biologicals' laboratories or external laboratory designated by GSK
**Refer to APPENDIX A for the laboratory addresses.
§GSK Biologicals laboratory refers to the Global Vaccines Clinical Laboratories (GVCL) in Rixensart, Belgium; Wavre, †
†Due to ongoing re-validation of all assays, the cut-offs may be subject to change.
‡For anti-PRP post-dose 3, the assay is not yet qualified or validated.
Belgium and Laval, Canada.
ELISA = Enzyme-Linked Immunosorbent Assay
NEUTRA = Neutralization Assay
CLIA = ChemiLuminescence ImmunoAssay

The GSK Biologicals' clinical laboratories have established a Quality System supported by procedures. The activities of GSK Biologicals' clinical laboratories are audited regularly for quality assessment by an internal (sponsor-dependent) but laboratory-independent Quality Department.

5.7.4. Biological samples evaluation

5.7.4.1. Immunological read-outs

The immunological read-outs are presented in Table 8.

Table 8 Immunological read-outs

Blood sampling time point		No. of subjects	Components and priority rank
Type of contact and time point	Sampling time point		
Visit 4 (Month 5)	Post-Pri	585 (All)	PRN, FHA, PT PRP, D, T, HBs, Poliovirus type 1, Poliovirus type 2, Poliovirus type 3
Visit 5 (Month 13-16)	Pre-Bst	585 (All)	PRN, FHA, PT PRP, D, T, HBs, Poliovirus type 1, Poliovirus type 2, Poliovirus type 3
Visit 6 (Month 14-17)	Post-Bst	585 (All)	PRN, FHA, PT, PRP, D, T

Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002

In case of insufficient blood sample volume to perform assays for all antibodies, the samples will be analysed according to priority ranking provided in Table 8.

5.7.5. Immunological correlates of protection

The following cut-offs are accepted as immunological correlates of protection:

- Specific antibodies against diphtheria toxoid (anti-diphtheria) and tetanus toxoid (anti-tetanus) will be measured by enzyme-linked immunosorbent assay (ELISA). The assay cut-off of ELISA is set at 0.1 International Units per ml (IU/ml), which provides a conservative estimate of the percentage of subjects deemed to be protected [Camargo, 1984; Melville-Smith, 1983].
- Antibodies to the hepatitis B surface antigen (anti-HBs) will be measured using CLIA. The cut-off of the test is set at 6.2 mIU/ml. An antibody concentration ≥10 mIU/ml defines seroprotection [CDC, 1991; WHO, 1988].
- Antibodies against poliovirus types 1, 2 and 3 will be determined by a virus micro-neutralization test adapted from the World Health Organization Guidelines for WHO/EPI Collaborative Studies on Poliomyelitis [WHO, 1993]. The lowest dilution at which serum samples will be tested is 1:8, from which a test will be considered positive. Titers will be expressed in terms of the reciprocal of the dilution resulting in 50% inhibition. Antibody titers greater than or equal to this value are considered as protective.
- Data from subjects given unconjugated Hib vaccine suggest that, in the absence of induction of immunological memory, a concentration of 0.15 µg/mL is indicative of short-term protection, with 1 µg/mL considered indicative of long-term protection [Käyhty, 1983; Anderson, 1984].
- No serological correlate of protection against pertussis has been established [Granström, 1987; Karpinsky, 1987]. Antibodies against the pertussis components

s PT, FHA and PRN will be measured by ELISA. The seropositivity cut-off for all three pertussis antibodies in ELISA is 5 EL.U/ml. Subjects with antibody concentration below the cut-off will be considered seronegative.

For the purpose of identification of sub-optimal responders and communication to the investigators, anti-HBs and anti-poliovirus types 1, 2 and 3 assessment of the protection level will be done for each subject on samples taken approximately 4 weeks after the 3rd dose of the primary vaccination. For PRP, D and T antigens, the assessment of the protection level will be done for each subject on samples taken approximately 4 weeks after the administration of the booster dose. In addition a listing of subjects who did not seroconvert to anti-PT, anti-FHA and anti-PRN will be provided.

The immunological assay results will be communicated to the investigator within one year following the last subject visit for the relevant time point (Visit 4 for HBV and poliovirus; Visit 6 for PRP, D, T and pertussis antigens).

The investigator is encouraged to share the immunological assay results for non-responders with the study subjects' parent(s)/LAR(s).

For the study subjects identified as non-responders, it remains the responsibility of the study investigator in charge of the subject's clinical management to determine the medical need for re-vaccination and to re-vaccinate the subjects as per local/regional practices.

6. STUDY VACCINES AND ADMINISTRATION

6.1. Description of study vaccines

All candidate vaccines to be used have been developed and manufactured by GSK Biologicals.

The Quality Control Standards and Requirements for each candidate vaccine are described in separate Quality Assurance documents (e.g. release protocols, certificate of analysis) and the required approvals have been obtained.

The vaccines are labeled and packed according to applicable regulatory requirements.

Commercial vaccines are assumed to comply with the specifications given in the manufacturer's Summary of Product Characteristics.

CONFIDENTIAL

Table 9 Study vaccines

(Amendment 2: 17 April 2015)

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Infanrix hexa	DTPa-HBV-IPV	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; Aluminium=700µg Al3+	The DTPa-HBV-IPV component is presented as a turbid white suspension in a pre-filled syringe.	full volume^	3

$CCID_{50}$ = median Cell Culture Infective Dose; DMEM = Dulbecco's Modified Eagle Medium
* After reconstitution
** Subjects in the Penta Group who receive a birth dose of hepatitis B vaccine should not receive *Engerix-B* at the Month 4 visit (Visit 2)
^ Full volume after reconstitution (approximately 0.5 mL) to be administered

6.2. Storage and handling of study vaccines

The study vaccines must be stored at the respective label storage temperature conditions in a safe and locked place. Access to the storage space should be limited to authorized study personnel. The storage conditions will be assessed during pre-study activities under the responsibility of the sponsor study contact. The storage temperature should be continuously monitored with calibrated (if not validated) temperature monitoring device(s) and recorded. Refer to the Module on Clinical Trial Supplies in the SPM for more details on storage of the study vaccines.

Temperature excursions must be reported in degree Celsius.

Any temperature excursion outside the range of 0.0 to +8.0°C (for +2 to +8°C/+36 to +46°F label storage condition) impacting investigational medicinal products (IMPs) must

be reported in the appropriate (electronic) temperature excursion decision form ([e]TDF). The impacted IMPs must not be used and must be stored in quarantine at label temperature conditions until usage approval has been obtained from the sponsor.

In case of temperature excursion below +2.0°C down to 0.0°C impacting IMP(s) there is no need to report in (e)TDF, but adequate actions must be taken to restore the +2 to +8°C/+36 to +46°F label storage temperature conditions. The impacted IMP(s) may still be administered, but the site should avoid re-occurrence of such temperature excursion. Refer to the Module on Clinical Trial Supplies in the SPM for more details on actions to take.

Refer to the Module on Clinical Trial Supplies in the SPM for details and instructions on the temperature excursion reporting and usage decision process, packaging and accountability of the study vaccines.

6.3. Dosage and administration of study vaccines

The injectable vaccines must be administered intramuscularly, at a 90-degree angle into the anterolateral side of the thigh [CDC, 2002] on the side stated in Table 10. The buttock should not be used.

In order to ensure proper intramuscular injection of the vaccines, a needle of at least 1 inch (2.54 cm) length, 25 gauge will be used [Diggle, 2006; Zuckerman, 2000].

For reconstitution of *Infanrix hexa* vaccine, an appropriate needle should be attached to the prefilled syringe containing the DTPa-HBV-IPV liquid vaccine and inserted into the vial containing the lyophilized Hib vaccine. The entire contents of the syringe should be transferred to the vial. With needle still inserted, the vial should be vigorously shaken. After reconstitution, the full volume of the vial (approximately 0.5 mL) is then withdrawn using the same syringe. A new needle should then be affixed to the syringe for administration of the vaccine.

NOTE: After reconstitution, *Infanrix hexa* should be injected immediately. However the vaccine may be kept for up to 8 hours at room temperature (21°C).

The vaccinees will be observed closely for at least 30 minutes following the administration of vaccines, with appropriate medical treatment readily available in case of a rare anaphylactic reaction.

Rotarix must be exclusively administered orally. DO NOT INJECT.

CONFIDENTIAL

[1]Oral (O), Intramuscular (IM); [2]Thigh (T), [3]Left (L), Right (R), Upper Left (UpL), Lower Left (LoL)
Note: Vaccination can be performed in the opposite side in case of medical indication preventing vaccination in the side stated in the table, as judged by the investigator
†Subjects in the Penta Group who receive a birth dose of hepatitis B vaccine should not receive *Engerix-B* at the Month 4 visit (Visit 2).
* Toddlers (12 Months through 2 Years): For toddlers, the vastus lateralis muscle in the anterolateral thigh is preferred. The needle should be at least 1-inch long. The deltoid muscle can be used if the muscle mass is adequate.

6.4. Replacement of unusable vaccine doses

In addition to the vaccine doses provided for the planned number of subjects (including over-randomization when applicable), at least 60% additional vaccine doses will be supplied to replace those that are unusable.

6.5. Contraindications to subsequent vaccination

6.5.1. Absolute contraindications:

The following events constitute absolute contraindications to further administration of the study and co-administration vaccines. If any of these events occur during the study, the subject must not receive additional doses of vaccine but may continue other study procedures at the discretion of the investigator.

- Anaphylaxis following the administration of vaccine(s).
- Other hypersensitivity reaction to any component of the vaccine(s) and any excipients in the formulation, including yeast.
- Hypersensitivity to latex.

CONFIDENTIAL

- Contraindication for pertussis-containing vaccines:
  - Encephalopathy of unknown etiology, defined as an acute, severe central nervous system disorder, occurring within 7 days following previous vaccination with pertussis-containing vaccine and generally consisting of major alterations in consciousness, unresponsiveness, generalised or focal seizures that persist more than a few hours, with failure to recover within 24 hours.
  - Individuals with progressive neurologic disorder, including infantile spasms, uncontrolled epilepsy, or progressive encephalopathy should not receive a pertussis-containing vaccine until a treatment regimen has been established and the condition has stabilized.
- Contraindications to *Rotarix*:
  - Subjects with uncorrected congenital malformation (such as Meckel's diverticulum) of the gastrointestinal tract that would predispose for intussusceptions.
  - History of intussusception or history of SCID.

6.5.2. Temporary contraindications:

The following events constitute contraindications to administration of the study and co-administration vaccines at that point in time; if any of these events occur at the time scheduled for vaccination, the subject may be vaccinated at a later date, within the time window specified in the protocol, or withdrawn at the discretion of the investigator.

- Acute disease and/or fever at the time of vaccination.
  - Fever is defined as temperature ≥ 38.0°C/100.4°F by any route. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002.
  - Subjects with a minor illness (such as mild upper respiratory infection) without fever can be administered all vaccines.
- Acute diarrhea or vomiting is a contra-indication to the administration of *Rotarix* at that point in time.

6.6. Warnings and precautions

The information below presents, in addition to the contraindications in Section 6.5, warnings and precautions to administration of *Infanrix hexa.*

- As with other vaccines, administration of *Infanrix hexa* should be postponed in subjects suffering from acute severe febrile illness. The presence of a minor infection is not a contra-indication.
- Vaccination should be preceded by a review of the medical history (especially with regard to previous vaccination and possible occurrence of undesirable events) and a clinical examination.

- If any of the following events are known to have occurred in temporal relation to receipt of pertussis-containing vaccine, the decision to give further doses of pertussis-containing vaccines should be carefully considered:
  - Temperature of ≥ 40.0°C within 48 hours, not due to another identifiable cause.
  - Collapse or shock-like state (hypotonic-hyporesponsiveness episode) within 48 hours of vaccination.
  - Persistent, inconsolable crying lasting ≥ 3 hours, occurring within 48 hours of vaccination.
  - Convulsions with or without fever, occurring within 3 days of vaccination.
- As with all injectable vaccines, appropriate medical treatment and supervision should always be readily available in case of a rare anaphylactic event following the administration of the vaccine.
- *Infanrix hexa* should be administered with caution to subjects with thrombocytopenia or a bleeding disorder since bleeding may occur following an intramuscular administration to these subjects.
- *Infanrix hexa* should under no circumstances be administered intravascularly or intradermally.
- A protective immune response may not be elicited in all vaccinees.
- A history of febrile convulsions, a family history of convulsions or Sudden Infant Death Syndrome (SIDS) do not constitute contraindications for the use of *Infanrix hexa*. Vaccinees with a history of febrile convulsions should be closely followed up as such adverse events may occur within 2 to 3 days post vaccination.
- Since the Hib capsular polysaccharide antigen is excreted in the urine a positive urine test can be observed within 1-2 weeks following vaccination. Other tests should be performed in order to confirm Hib infection during this period.
- Syncope (fainting) can occur following, or even before, any vaccination as a psychogenic response to the needle injection. It is important that procedures are in place to avoid injury from faints.

Refer to the approved product label/package insert for warnings and precautions for the use of *Pediarix, ActHIB, Pentacel, Engerix-B, Prevnar13, Rotarix, Hiberix* and *Infanrix* vaccines.

6.7. Concomitant medication/product and concomitant vaccination

At each study visit/contact, the investigator should question the subject's parent(s)/LAR(s) about any medication/product taken and vaccination received by the subject.

CONFIDENTIAL

6.7.1. Recording of concomitant medications/products and concomitant vaccination

The following concomitant medications/products/vaccines must be recorded in the eCRF if administered during the indicated recording period:

- All concomitant medications/products, except vitamins and dietary supplements, administered within 30 days following each dose of study vaccine.
- Any concomitant vaccination administered since birth and ending 30 days after the booster dose (Visit 6). Vaccinations listed prior to the first dose of study vaccine are to be recorded as vaccination history. The fourth dose of *Prevnar 13* will be recorded as concomitant vaccination.
- Prophylactic medication (i.e. medication administered in the absence of ANY symptom and in anticipation of a reaction to the vaccination).

  E.g. an anti-pyretic is considered to be prophylactic when it is given in the absence of fever and any other symptom, to prevent fever from occurring [fever is defined as temperature ≥ 38.0°C/100.4°F by any route].
- Any concomitant medications/products/vaccines listed in Section 6.7.2.
- Any concomitant medication/product/vaccine relevant to a SAE* or administered at any time during the study period for the treatment of a SAE*.

  * Refer to those SAEs that are required to be reported per protocol.

6.7.2. Concomitant medications/products/vaccines that may lead to the elimination of a subject from ATP analyses

The use of the following concomitant medications/products/vaccines will not require withdrawal of the subject from the study but may determine a subject's evaluability in the ATP analysis. See Section 10.4 for study cohorts/ data sets to be analysed.

- Any investigational or non-registered product (drug or vaccine) other than the study vaccines used during the study period (starting from Visit 1 and ending at Visit 6).
- Immunosuppressants or other immune-modifying drugs administered chronically (i.e. more than 14 days) during the study period until the final blood sample (Visit 6). For corticosteroids, this will mean prednisone ≥ 0.5 mg/kg/day, or equivalent. Inhaled and topical steroids are allowed.
- A vaccine not foreseen by the study protocol administered during the period starting from 30 days before the first vaccination until Post-Pri blood sampling i.e. approximately 30 days after Dose 3 (Epoch 001) and from 30 days before Pre-Bst until Post-Bst blood sampling i.e. approximately 30 days after Dose 4 (Epoch 002). Thus, routine administration(s) of measles-mumps-rubella, varicella and pneumococcal vaccines are allowed from 30 days after the last dose of primary vaccination (after Post-Pri blood sampling) until 30 days before the booster dose and from 30 days after the booster dose (after Post-Bst blood sampling), as well as according to the recommended immunization schedule in the US.

- Exceptions:
  - Inactivated influenza vaccine and hepatitis A vaccines are allowed throughout the study.

  In case an emergency mass vaccination for an unforeseen public health threat (e.g.: a pandemic) is organized by the public health authorities, outside the routine immunization program, the time period described above can be reduced if necessary for that vaccine provided it is licensed and used according to its SPC or PI and according to the local governmental recommendations and provided a written approval of the Sponsor is obtained.
- Immunoglobulins and/or any blood products administered during the study period until the final blood sample (Visit 6).

6.8. Intercurrent medical conditions that may lead to elimination of a subject from ATP analyses

At each study visit subsequent to the first vaccination visit, it must be verified if the subject has experienced or is experiencing any intercurrent medical condition. If it is the case, the condition(s) must be recorded in the eCRF.

- Subjects may be eliminated from the ATP cohort for immunogenicity if they incur a condition that has the capability of altering their immune response or are confirmed to have an immunodeficiency condition.
- Subjects will be eliminated from the ATP cohort for immunogenicity if they experience intercurrent diphtheria, tetanus, pertussis, poliomyelitis, hepatitis B and/or Hib prior to the post-dose 3 blood draw and diphtheria, tetanus, pertussis and/or Hib post-dose 4 blood draw.

7. HEALTH ECONOMICS

Not applicable.

8. SAFETY

The investigator or site staff is/are responsible for the detection, documentation and reporting of events meeting the criteria and definition of an adverse event (AE) or serious adverse event (SAE) as provided in this protocol.

Each subject's parent(s)/LAR(s) will be instructed to contact the investigator immediately should the subject manifest any signs or symptoms they perceive as serious.

8.1. Safety definitions

8.1.1. Definition of an adverse event

An AE is any untoward medical occurrence in a clinical investigation subject, temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product.

An AE can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a medicinal product. For marketed medicinal products, this also includes failure to produce expected benefits (i.e. lack of efficacy), abuse or misuse.

Examples of an AE include:

- Significant or unexpected worsening or exacerbation of the condition/indication under study.
- New conditions detected or diagnosed after investigational vaccines administration even though they may have been present prior to the start of the study.
- Signs, symptoms, or the clinical sequelae of a suspected interaction.
- Signs, symptoms, or the clinical sequelae of a suspected overdose of either investigational vaccines or a concurrent medication (overdose per se should not be reported as an AE/SAE).
- Signs, symptoms temporally associated with vaccine administration.
- Significant failure of expected pharmacological or biological action.
- Pre- or post-treatment events that occur as a result of protocol-mandated procedures (i.e. invasive procedures, modification of subject's previous therapeutic regimen).

AEs to be recorded as endpoints (solicited AEs) are described in Section 8.1.3. All other AEs will be recorded as UNSOLICITED AEs.

Examples of an AE DO NOT include:

- Medical or surgical procedures (e.g. endoscopy, appendectomy); the condition that leads to the procedure is an AE/SAE.
- Situations where an untoward medical occurrence did not occur (e.g. social and/or convenience admission to a hospital, admission for routine examination).
- Anticipated day-to-day fluctuations of pre-existing disease(s) or condition(s) present or detected at the start of the study that do not worsen.
- Pre-existing conditions or signs and/or symptoms present in a subject prior to the first study vaccination. These events will be recorded in the medical history section of the eCRF**.**

8.1.2. Definition of a serious adverse event

A serious adverse event is any untoward medical occurrence that:

a. Results in death,

b. Is life-threatening,

   Note: The term 'life-threatening' in the definition of 'serious' refers to an event in which the subject was at risk of death at the time of the event. It does not refer to an event, which hypothetically might have caused death, had it been more severe.

c. Requires hospitalisation or prolongation of existing hospitalisation,

   Note: In general, hospitalisation signifies that the subject has been admitted at the hospital or emergency ward for observation and/or treatment that would not have been appropriate in the physician's office or in an out-patient setting. Complications that occur during hospitalisation are also considered AEs. If a complication prolongs hospitalisation or fulfils any other serious criteria, the event will also be considered serious. When in doubt as to whether 'hospitalisation' occurred or was necessary, the AE should be considered serious.

   Hospitalisation for elective treatment of a pre-existing condition (known or diagnosed prior to informed consent signature) that did not worsen from baseline is NOT considered an AE.

d. Results in disability/incapacity,

   Note: The term disability means a substantial disruption of a person's ability to conduct normal life functions. This definition is not intended to include experiences of relatively minor medical significance such as uncomplicated headache, nausea, vomiting, diarrhea, influenza like illness, and accidental trauma (e.g. sprained ankle) which may interfere or prevent everyday life functions but do not constitute a substantial disruption.

Medical or scientific judgement should be exercised in deciding whether reporting is appropriate in other situations, such as important medical events that may not be immediately life-threatening or result in death or hospitalisation but may jeopardise the subject or may require medical or surgical intervention to prevent one of the other outcomes listed in the above definition. These should also be considered serious. Examples of such events are invasive or malignant cancers, intensive treatment in an emergency room or at home for allergic bronchospasm, blood dyscrasias or convulsions that do not result in hospitalisation.

8.1.3. Solicited adverse events

A 4-day follow-up (Day 0-Day 3) of solicited local (at each injection site) and general AEs will be performed after administration of the vaccine. Data concerning the following AEs will be solicited using diary cards provided by the sponsor.

8.1.3.1. Solicited local (injection-site) adverse events

The following local (injection-site) AEs will be solicited (Table 11):

Table 11 Solicited local adverse events

Pain at injection site
Redness at injection site
Swelling at injection site
Post-dose 4 measurements of circumference of limbs (arm or leg according to where vaccine was administered)

N.B. If parent(s) /LAR(s) of infants observe any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of limb circumference) after the booster dose at Visit 5, they are to contact study personnel and to visit the investigator's office for evaluation as soon as possible and bring the diary card with them. The investigator will record detailed information describing the AE on a specific large injection site reaction form in the eCRF. In addition to the diameter of the swelling and the circumference of the limb that are reported as solicited symptoms the parent(s)/LAR(s) will need to record additional symptoms/characteristics as mentioned in Section 5.6.2.13.

Note: local AEs will not be solicited for co-administered vaccines like *Prevnar 13*.

8.1.3.2. Solicited general adverse events

The following general AEs will be solicited (Table 12):

Table 12 Solicited general adverse events

Drowsiness
Fever
Irritability/Fussiness
Loss of appetite

Note: Temperature will be recorded in the evening. Should additional temperature measurements be performed at other times of day, the highest temperature will be recorded. Fever is defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002.

8.1.4. Clinical laboratory parameters and other abnormal assessments qualifying as adverse events or serious adverse events

In absence of diagnosis, abnormal laboratory findings (e.g. clinical chemistry, haematology, urinalysis) or other abnormal assessments (e.g. vital signs etc.) that are judged by the investigator to be clinically significant will be recorded as AE or SAE if they meet the definition of an AE or SAE (refer to Sections 8.1.1 and 8.1.2). Clinically significant abnormal laboratory findings or other abnormal assessments that are present at

baseline and significantly worsen following the start of the study will also be reported as AEs or SAEs. However, clinically significant abnormal laboratory findings or other abnormal assessments that are associated with the disease being studied, unless judged by the investigator as more severe than expected for the subject's condition, or that are present or detected at the start of the study and do not worsen, will not be reported as AEs or SAEs.

The investigator will exercise his or her medical and scientific judgement in deciding whether an abnormal laboratory finding or other abnormal assessment is clinically significant.

8.1.5. Adverse events of specific interest

Adverse events of specific interest (i.e. NOCDs such as autoimmune disorders, asthma, type I diabetes and allergies) will be recorded from Day 0 up to 6 months after the last primary vaccination (Epoch 001) and from booster dose up to one month after booster vaccination (Epoch 002). NOCDs will be reported as either AEs or SAEs, as appropriate in the eCRF.

8.2. Events or outcomes not qualifying as adverse events or serious adverse events

Not applicable.

8.3. Detecting and recording adverse events and serious adverse events

8.3.1. Time period for detecting and recording adverse events and serious adverse events

All AEs starting within 30 days following administration of each dose of study vaccine/comparator must be recorded into the appropriate section of the eCRF, irrespective of intensity or whether or not they are considered vaccination-related.

The time period for collecting and recording SAEs and AEs of specific interest will begin at the first receipt of study vaccine/comparator and will end 180 days following administration of the last dose of study vaccine/comparator of the primary vaccination course for each subject and 30 days following administration of the booster dose. See Section 8.4 for instructions on reporting of SAEs.

All AEs/SAEs leading to withdrawal from the study will be collected and recorded from the time of the first receipt of study vaccine/comparator.

In addition to the above-mentioned reporting requirements and in order to fulfil international reporting obligations, SAEs that are related to study participation (i.e. protocol-mandated procedures, invasive tests, a change from existing therapy) or are related to a concurrent GSK medication/vaccine will be collected and recorded from the time the subject consents to participate in the study until she/he is discharged from the study.

Note: With the exception of AEs/SAEs leading to withdrawal, study participation and concurrent GSK medications or vaccines, there is no reporting of SAEs from the time of the Epoch 1 ESFU phone contact and administration of dose 4 (approximately three months).

An overview of the protocol-required reporting periods for AEs and SAEs is given in Table 13.

CONFIDENTIAL

Table 13 Reporting periods for adverse events and serious adverse events

Study activity	C.O	V1	4-days post vac	31-days post-vac	V2	4-days post vac	31-days post-vac	V3	4-days post- vac	31-days post-vac	Phone call 6 months post-V3	V5	4-days post- vac	31-days post-vac
Age of subject		2 months			4 months			6 months		7 months	12 months	15-18 months		16-19 months
Solicited local and general AEs														
Large injection site reactions														
Unsolicited AEs														
AEs/SAEs leading to withdrawal from the study														
NOCDs														
SAEs														
SAEs related to study participation or concurrent GSK medication/vaccine														

NOCD: New Onset of Chronic Diseases; C.O: consent obtained; V: Visit; Post-V: Post-Visit; vac: vaccination

8.3.2. Post-Study adverse events and serious adverse events

A post-study AE/SAE is defined as any event that occurs outside of the AE/SAE reporting period defined in Table 13. Investigators are not obligated to actively seek AEs or SAEs in former study participants. However, if the investigator learns of any SAE at any time after a subject has been discharged from the study, and he/she considers the event reasonably related to the investigational vaccine/product, the investigator will promptly notify the Study Contact for Reporting SAEs.

8.3.3. Evaluation of adverse events and serious adverse events

8.3.3.1. Active questioning to detect adverse events and serious adverse events

As a consistent method of collecting AEs, the subject's parent(s)/LAR(s) should be asked a non-leading question such as:

'*Has your child acted differently or felt different in any way since receiving the vaccine or since the last visit?*'

When an AE/SAE occurs, it is the responsibility of the investigator to review all documentation (e.g. hospital progress notes, laboratory and diagnostics reports) relative to the event. The investigator will then record all relevant information regarding an AE/SAE in the eCRF. The investigator is not allowed to send photocopies of the subject's medical records to GSK Biologicals instead of appropriately completing the eCRF. However, there may be instances when copies of medical records for certain cases are requested by GSK Biologicals. In this instance, all subject identifiers will be blinded on the copies of the medical records prior to submission to GSK Biologicals.

The investigator will attempt to establish a diagnosis pertaining to the event based on signs, symptoms, and/or other clinical information. In such cases, the diagnosis should be documented as the AE/SAE and not the individual signs/symptoms.

CONFIDENTIAL

8.3.3.2. Assessment of adverse events

8.3.3.2.1. Assessment of intensity

The intensity of the following solicited AEs will be assessed as described:

Table 14 Intensity scales for solicited symptoms in infants/toddlers

Infant/Toddler (15–24 months)		
Adverse Event	**Intensity grade**	**Parameter**
Pain at injection site	0	None
	1	Mild: Minor reaction to touch
	2	Moderate: Cries/protests on touch
	3	Severe: Cries when limb is moved/spontaneously painful
Redness at injection site		Record greatest surface diameter in mm
Swelling at injection site		Record greatest surface diameter in mm
Increase in limb circumference post-dose 4 (arm or leg according to where vaccine was administered)		Record the limb circumference at the level of the injection site
Fever*		Record temperature in °C/°F
Irritability/Fussiness	0	Behaviour as usual
	1	Mild: Crying more than usual/no effect on normal activity
	2	Moderate: Crying more than usual/interferes with normal activity
	3	Severe: Crying that cannot be comforted/prevents normal activity
Drowsiness	0	Behaviour as usual
	1	Mild: Drowsiness easily tolerated
	2	Moderate: Drowsiness that interferes with normal activity
	3	Severe: Drowsiness that prevents normal activity
Loss of appetite	0	Appetite as usual
	1	Mild: Eating less than usual/no effect on normal activity
	2	Moderate: Eating less than usual/interferes with normal activity
	3	Severe: Not eating at all

* Fever is defined as temperature ≥38.0°C /100.4°F by any route. The preferred route for recording temperature in this study will be rectal for Epoch 001 and axillary for Epoch 002.

The maximum intensity of local injection site redness/swelling/fever will be scored at GSK Biologicals as follows:

0 : Absent
1 : ≤ 5 mm
2 : > 5 mm and ≤ 20 mm
3 : > 20 mm

The maximum intensity of fever will be scored at GSK Biologicals as follows:

0	=	<100.4°F	<38.0°C
1	=	≥100.4°F to ≤102.2°F	≥38.0°C to ≤39.0°C
2	=	>102.2°F to ≤104.0°F	>39.0°C to ≤40.0°C
3	=	> 104.0°F	> 40.0°C

Following each vaccination (3 doses during the primary vaccination course and one booster dose) during the 4 days after the vaccine dose has been administered (day of vaccination and subsequent 3 days), the child's temperature will be screened each evening, at bedtime, for signs of fever by means of the rectal/axillary thermometer. Children < 15 months will have their temperature taken rectally and children ≥ 15 months will have their temperature taken by the axillary route. Rectal/axillary temperatures will be recorded on the diary card. Temperature measured by any route will be presented in 0.5°C increments starting at 38°C/100.4°F.

Prior to analysis, the increase in limb circumference of each limb as compared to the baseline pre-vaccination measurement will be scored for each subject at GSK Biologicals' as follows:

Grade 0 = Increase in limb circumference ≤5 mm

1 = Increase in limb circumference >5 mm but ≤20 mm

2 = Increase in limb circumference >20 mm but ≤40 mm

3 = Increase in limb circumference >40 mm

The investigator will assess the maximum intensity that occurred over the duration of the event for all unsolicited AEs (including SAEs) recorded during the study. The assessment will be based on the investigator's clinical judgement.

For unsolicited symptoms and adverse events associated with large injection site reactions (e.g. pruritus, induration and functional impairment, the intensity should be assigned to one of the following categories:

1 (mild)	=	An AE which is easily tolerated by the subject, causing minimal discomfort and not interfering with everyday activities.
2 (moderate)	=	An AE which is sufficiently discomforting to interfere with normal everyday activities.
3 (severe)	=	An AE which prevents normal, everyday activities. In a young child, such an AE would, for example, prevent attendance at school/kindergarten/a day-care center and would cause the parent(s)/LAR(s) to seek medical advice.

An AE that is assessed as Grade 3 (severe) should not be confused with a SAE. Grade 3 is a category used for rating the intensity of an event; and both AEs and SAEs can be assessed as Grade 3. An event is defined as 'serious' when it meets one of the pre-defined outcomes as described in Section 8.1.2.

8.3.3.2.2. Assessment of causality

The investigator is obligated to assess the relationship between investigational vaccines and the occurrence of each AE/SAE. The investigator will use clinical judgement to determine the relationship. Alternative plausible causes, such as natural history of the underlying diseases, concomitant therapy, other risk factors, and the temporal relationship of the event to the investigational vaccines will be considered and investigated. The investigator will also consult the IB and/or PI for marketed products to determine his/her assessment. Investigational vaccines include vaccines such as *Infanrix hexa*, *Pediarix*, *Pentacel*, *ActHIB*, *Engerix-B*, *Rotarix*, *Prevnar 13*, *Infanrix* and *Hiberix*.

There may be situations when a SAE has occurred and the investigator has minimal information to include in the initial report to GSK Biologicals. However, it is very important that the investigator always makes an assessment of causality for every event prior to submission of the SAE report to GSK Biologicals. The investigator may change his/her opinion of causality in light of follow-up information and update the SAE information accordingly. The causality assessment is one of the criteria used when determining regulatory reporting requirements.

In case of concomitant administration of multiple vaccines, it may not be possible to determine the causal relationship of general AEs to the individual vaccines administered. The investigator should, therefore, assess whether the AE could be causally related to vaccination rather than to the individual vaccines.

All solicited local (injection site) reactions will be considered causally related to vaccination. Causality of all other AEs should be assessed by the investigator using the following question:

CONFIDENTIAL

Is there a reasonable possibility that the AE may have been caused by the investigational vaccines?

YES	:	There is a reasonable possibility that the vaccines contributed to the AE.
NO	:	There is no reasonable possibility that the AE is causally related to the administration of the study vaccine(s). There are other, more likely causes and administration of the study vaccine(s) is not suspected to have contributed to the AE.

If an event meets the criteria to be determined as 'serious' (see Section 8.1.2), additional examinations/tests will be performed by the investigator in order to determine ALL possible contributing factors for each SAE.

Possible contributing factors include:

- Medical history.
- Other medication.
- Protocol required procedure.
- Other procedure not required by the protocol.
- Lack of efficacy of the vaccines, if applicable.
- Erroneous administration.
- Other cause (specify).

8.3.3.3. Assessment of outcomes

The investigator will assess the outcome of all unsolicited AEs (including SAEs) recorded during the study as:

- Recovered/resolved.
- Recovering/resolving.
- Not recovered/not resolved.
- Recovered with sequelae/resolved with sequelae.
- Fatal (SAEs only).

8.3.3.4. Medically attended visits

For each solicited and unsolicited symptom the subject experiences, the subject's parent(s)/LAR(s) will be asked if the subject received medical attention defined as hospitalisation, or an otherwise unscheduled visit to or from medical personnel for any reason, including emergency room visits. This information will be recorded in the eCRF.

8.4. Reporting of serious adverse events and other events

8.4.1. Prompt reporting of serious adverse events and other events to GSK Biologicals

SAEs that occur in the time period defined in Section 8.3 will be reported promptly to GSK within the timeframes described in Table 15, once the investigator determines that the event meets the protocol definition of a SAE.

Table 15 Timeframes for submitting serious adverse event and other events reports to GSK Biologicals

Type of Event	Initial Reports		Follow-up of Relevant Information on a Previous Report	
	Timeframe	Documents	Timeframe	Documents
SAEs	24 hours*	electronic SAE report	24 hours*	electronic SAE report

* Timeframe allowed after receipt or awareness of the information.

8.4.2. Contact information for reporting serious adverse events and other events to GSK Biologicals

Back-up Study Contact for Reporting SAEs
24/24 hour and 7/7 day availability: GSK Biologicals Clinical Safety & Pharmacovigilance Fax: PPD or PPD Please refer to the Study Procedure Manual for the dedicated US Fax Machine number.

8.4.3. Completion and transmission of SAE reports to GSK Biologicals

Once an investigator becomes aware that a SAE has occurred in a study subject, the investigator (or designate) must complete the information in the electronic SAE report WITHIN 24 HOURS. The SAE report will always be completed as thoroughly as possible with all available details of the event. Even if the investigator does not have all information regarding a SAE, the report should still be completed within 24 hours. Once additional relevant information is received, the report should be updated WITHIN 24 HOURS.

The investigator will always provide an assessment of causality at the time of the initial report.

8.4.3.1. Back-up system in case the electronic SAE reporting system does not work

If the electronic SAE reporting system does not work, the investigator (or designate) must complete, then date and sign a paper SAE report and fax it to the GSK Biologicals Clinical Safety and Pharmacovigilance department within 24 hours. Please refer to the Study Procedure Manual for the dedicated US Fax Machine number.

This back-up system should only be used if the electronic SAE reporting system is not working and NOT if the system is slow. As soon as the electronic SAE reporting system is working again, the investigator (or designate) must complete the electronic SAE report within 24 hours. The final valid information for regulatory reporting will be the information reported through the electronic SAE reporting system.

8.4.4. Updating of SAE information after freezing of the subject's eCRF

When additional SAE information is received after freezing of the subject's eCRF, new or updated information should be recorded on a paper report, with all changes signed and dated by the investigator. The updated report should be faxed to the GSK Biologicals Clinical Safety and Pharmacovigilance department or to the Study Contact for Reporting SAEs (refer to the Sponsor Information Sheet) within the designated reporting time frames specified in Table 15.

8.4.5. Regulatory reporting requirements for serious adverse events

The investigator will promptly report all SAEs to GSK in accordance with the procedures detailed in Section 8.4.1. GSK Biologicals has a legal responsibility to promptly notify, as appropriate, both the local regulatory authority and other regulatory agencies about the safety of a product under clinical investigation. Prompt notification of SAEs by the investigator to the Study Contact for Reporting SAEs is essential so that legal obligations and ethical responsibilities towards the safety of other subjects are met.

Investigator safety reports are prepared according to the current GSK policy and are forwarded to investigators as necessary. An investigator safety report is prepared for a SAE(s) that is both attributable to the investigational vaccine/product and unexpected. The purpose of the report is to fulfil specific regulatory and GCP requirements, regarding the product under investigation.

8.5. Follow-up of adverse events and serious adverse events

8.5.1. Follow-up during the study

After the initial AE/SAE report, the investigator is required to proactively follow each subject and provide additional relevant information on the subject's condition to GSK Biologicals (within 24 hours for SAEs; refer to Table 15).

All SAEs documented at a previous visit/contact and designated as not recovered/not resolved or recovering/resolving will be reviewed at subsequent visits/contacts until the end of the study.

All AEs documented at a previous visit/contact and designated as not recovered/not resolved or recovering/resolving will be reviewed at subsequent visits/contacts until 30 days after the last vaccination.

New onset of chronic diseases (such as autoimmune disorders, asthma, type I diabetes and allergies) documented at a previous visit/contact and designated as not recovered/not

resolved or recovering/resolving will be reviewed at subsequent visits/contacts until end of the study.

8.5.2. Follow-up after the subject is discharged from the study

The investigator will follow subjects:

- with SAEs, or subjects withdrawn from the study as a result of an AE, until the event has resolved, subsided, stabilized, disappeared, or until the event is otherwise explained, or the subject is lost to follow-up.
- with other non-serious AEs of specific interest, i.e. NOCDs, such as autoimmune disorders, asthma, type I diabetes and allergies, until the end of the study period or they are lost to follow-up.

If the investigator receives additional relevant information on a previously reported SAE, he/she will provide this information to GSK Biologicals using a paper SAE form.

GSK Biologicals may request that the investigator performs or arranges the conduct of additional clinical examinations/tests and/or evaluations to elucidate as fully as possible the nature and/or causality of the AE or SAE. The investigator is obliged to assist. If a subject dies during participation in the study or during a recognized follow-up period, GSK Biologicals will be provided with any available post-mortem findings, including histopathology.

8.6. Treatment of adverse events

Treatment of any AE is at the sole discretion of the investigator and according to current good medical practice. Any medication administered for the treatment of an AE should be recorded in the subject's eCRF (refer to Section 6.7).

8.7. Subject card

Study subjects' parent(s)/LAR(s) must be provided with the address and telephone number of the main contact for information about the clinical study.

The investigator (or designate) must therefore provide a "subject card" to each subject's parent(s)/LAR(s). In an emergency situation this card serves to inform the responsible attending physician that the subject is in a clinical study and that relevant information may be obtained by contacting the investigator.

Subjects' parent(s)/LAR(s) must be instructed to keep subject cards in their possession at all times.

9. SUBJECT COMPLETION AND WITHDRAWAL

9.1. Subject completion

A subject who returns for the concluding visit/is available for the concluding contact foreseen in the protocol is considered to have completed the study.

9.2. Subject withdrawal

Withdrawals will not be replaced.

9.2.1. Subject withdrawal from the study

From an analysis perspective, a 'withdrawal' from the study refers to any subject who did not come back for the concluding visit/was not available for the concluding contact foreseen in the protocol.

All data collected until the date of withdrawal/last contact of the subject will be used for the analysis.

A subject is considered a 'withdrawal' from the study when no study procedure has occurred, no follow-up has been performed and no further information has been collected for this subject from the date of withdrawal/last contact.

Investigators will make an attempt to contact those subjects who do not return for scheduled visits or follow-up.

Information relative to the withdrawal will be documented in the eCRF. The investigator will document whether the decision to withdraw a subject from the study was made by the subject's parent(s) or LAR(s), or by the investigator, as well as which of the following possible reasons was responsible for withdrawal:

- Serious adverse event.
- Non-serious adverse event.
- Protocol violation (specify).
- Consent withdrawal, not due to an adverse event*.
- Moved from the study area.
- Lost to follow-up.
- Other (specify).

*In case a subject is withdrawn from the study because the subject's parent(s) has withdrawn consent, the investigator will document the reason for withdrawal of consent, if specified by the subject, in the eCRF.

Subjects who are withdrawn from the study because of SAEs/AEs must be clearly distinguished from subjects who are withdrawn for other reasons. Investigators will follow subjects who are withdrawn from the study as result of a SAE/AE until resolution of the event (see Section 8.5.2).

9.2.2. Subject withdrawal from investigational vaccine

A 'withdrawal' from the investigational vaccine refers to any subject who does not receive the complete treatment, i.e. when no further planned dose is administered from

the date of withdrawal. A subject withdrawn from the investigational vaccine may not necessarily be withdrawn from the study as further study procedures or follow-up may be performed (safety or immunogenicity) if planned in the study protocol.

Information relative to premature discontinuation of the investigational vaccine will be documented on the Vaccine Administration screen of the eCRF. The investigator will document whether the decision to discontinue further vaccination/treatment was made by the subject's parent(s) or LAR(s), or by the investigator, as well as which of the following possible reasons was responsible for withdrawal:

- Serious adverse event.
- Non-serious adverse event.
- Other (specify).

10. STATISTICAL METHODS

10.1. Primary endpoint

10.1.1. Epoch 001 (Primary vaccination)

- Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.

10.2. Secondary endpoints

10.2.1. Epoch 001 (Primary vaccination)

- Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa, Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*.
  - Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3 and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.

CONFIDENTIAL

- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after each vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after each vaccination, according to the **Med**ical **D**ictionary for **R**egulatory **A**ctivities (MedDRA) classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from Day 0 up to six months post primary vaccination.

10.2.2. Epoch 002 (Booster vaccination)

- Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Infanrix.*
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).

CONFIDENTIAL

  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix*.
  - Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4)
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after booster vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after booster vaccination, according to the MedDRA classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from the booster dose up to one month after the booster vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from the booster dose up to one month after the booster vaccination.

10.3. Determination of sample size

Target enrolment will be 585 subjects. Assuming 65% of the subjects will be evaluable post-dose 3, this will provide approximately 378 subjects (126 subjects in each group) evaluable for immunogenicity in the Epoch 001.

The sample size has been estimated in order to obtain at least 94% power to demonstrate the primary inferential objective (i.e. non-inferiority of the response to the pertussis antigens). The power associated to the target sample size for the conclusion on the inferential primary objective of this study is detailed in the next section.

10.3.1. Control on type I error

A 2.5% nominal type I error will be used for each pertussis non-inferiority (NI) evaluation. Since NI has to be met simultaneously for the 3 pertussis antigens, the global type I error will be below 2.5%.

10.3.2. References for sample size

References were chosen based on observed standard deviations observed in studies Hib-MenCY-TT-005 (101858) and Hib-MenCY-TT-009 (103813) one month post-dose 3 from the subjects that receive *ActHIB* co-administered with *Pediarix* and *Prevnar*, and from study DTPa-HBV-IPV-027 (217744/027) one month post-dose 3 from the DTPa-HBV-IPV/Hib pooled groups. All these studies enrolled subjects in the US.

The standard deviation for $\log_{10}$ transformed concentrations post vaccination for pertussis antigens is presented in Table 16.

Table 16 Standard deviation for $\log_{10}$ transformed concentration post vaccination

Study	Antigen					
	PT		FHA		PRN	
	N	SD	N	SD	N	SD
Hib-MenCY-TT-005-US	215	0.274	213	0.312	217	0.392
Hib-MenCY-TT-009 – US cohort	100	0.258	97	0.252	101	0.482
DTPa-HBV-IPV-027-US	865	0.274	802	0.254	869	0.376
Reference taken		0.274		0.307		0.392

N: Number of subjects; SD: standard deviation

10.3.3. Power computation

Out of the 585 subjects enrolled, 65% (126 in each pooled group) are expected to be evaluable post-Dose 3.

The individual type II error for each pertussis antigen was obtained using PASS 2005, one-sided non-inferiority test for 2 means from normal data with common variance between groups, under the alternative of equal means and alpha=2.5% (Table 17).

To account for the multiplicity of comparisons, the global type II error was conservatively estimated as the sum of individual type II errors, ensuring a global power for the study of 94.02% as presented in Table 17.

Table 17 Power for pertussis NI post-Dose 3

Antigen	Margin	SD on $\log_{10}$ transformed titer	Type I error	N evaluable per pooled group	Type II error
PT	1.5	0.274	2.5%	126	0.08%
FHA	1.5	0.307	2.5%	126	0.48%
PRN	1.5	0.392	2.5%	126	5.42%
Global Power = 100-(0.08+0.48+5.42) % = 94.02%					

10.4. Study cohorts/ data sets to be analysed

Six cohorts are defined for the purpose of the analysis:

- Primary Total Vaccinated cohort
- Primary ATP cohort for analysis of safety
- Primary ATP cohort for analysis of immunogenicity
- Booster Total Vaccinated cohort
- Booster ATP cohort for analysis of safety
- Booster ATP cohort for analysis of immunogenicity

10.4.1. Primary Total vaccinated cohort

The Primary Total Vaccinated cohort (TVC) will include all vaccinated subjects for whom data are available.

- A safety analysis based on the Primary TVC will include all subjects with at least one vaccine administration documented.
- An immunogenicity analysis based on the Primary TVC will include all vaccinated subjects for whom data concerning at least one immunogenicity endpoint measure is available.

10.4.2. Primary ATP cohort for analysis of safety

The Primary ATP cohort for safety will consist of all subjects from the Primary TVC who complied with the protocol up to the end of Epoch 001, namely all subjects:

- who meet all inclusion criteria and no exclusion criteria for the study
- who have received all planned study vaccines for each completed vaccination visit in Epoch 001;
- for whom administration site of study vaccines is known and is according to protocol;
- who did not receive a product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.7.2.

Note that for the purpose of ATP cohort definition, the Epoch 001 ends at Visit 4.

Adherence to the interval related to ESFU phone contact will not be taken into account for inclusion in ATP cohort for safety.

10.4.3. Primary ATP cohort for analysis of immunogenicity

The Primary ATP cohort for immunogenicity will consist of all subjects from the Primary ATP cohort for safety who complied with eligibility criteria and study procedures (see Table 5 for the definition of the intervals) up to the post-dose 3 blood sample and had immunogenicity results for the post-dose 3 blood sample. The analysis will be performed per treatment (first dose) actually administered.

More specifically, the analysis post-dose 3 based on the ATP cohort for immunogenicity will include all eligible subjects:

- who receive all the study vaccines up to dose 3 as per the vaccination schedule;
- for whom administration site and route of study vaccines up to dose 3 is as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.7.2
- who did not present with a medical condition before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.8.
- who comply with the post-dose 3 blood sample schedule, i.e. 21-48 days post-dose 3.
- who were not administered a vaccine not foreseen by the study protocol before the corresponding post-vaccination blood sample.
- who have immunogenicity results post-dose 3.

10.4.4. Booster Total vaccinated cohort

The Booster TVC will include all subjects from primary TVC that received the booster vaccine dose.

- For the Booster-TVC analysis of safety, this will include all subjects with booster vaccine administration documented.
- For the Booster-TVC analysis of immunogenicity, this will include vaccinated subjects for whom data concerning immunogenicity endpoint measures are available.

10.4.5. Booster ATP cohort for analysis of safety

The Booster ATP cohort for safety will consist of all subjects from the Booster TVC who complied with the protocol up to the end of Epoch 002, namely all subjects:

- who meet all inclusion criteria and no exclusion criteria for the study
- who have received the planned booster dose at 15-18 months of age;
- who received 3 doses in Epoch 001;
- for whom administration site of study vaccines is known and is according to protocol;

- who did not receive a product before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis as listed in Section 6.7.2.

10.4.6. Booster ATP cohort for analysis of immunogenicity

The Booster ATP cohort for immunogenicity will consist of all subjects from the Booster ATP cohort for safety who complied with eligibility criteria and study procedures (see Table 5 for the definition of the intervals) up to the post-dose 4 blood sample and had immunogenicity results for the post-dose 4 blood sample.

More specifically, the analysis pre- and post-dose 4 based on the Booster ATP cohort for immunogenicity will include all eligible subjects:

- who receive all the study vaccines up to dose 4 as per the vaccination schedule;
- for whom administration site and route of the study vaccines up to dose 4 is as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis (see Section 6.7.2);
- who did not present with a medical condition before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis (see Section 6.8);
- who comply with the booster vaccination schedule at 15-18 months of age and with the post-dose 4 blood sample schedule i.e. 21-48 days for post-dose 4;
- who have immunogenicity results post-dose 4.

10.5. Derived and transformed data

- A seronegative subject is a subject whose antibody concentration/titer is below the assay cut-off.
- A seropositive subject is a subject whose antibody concentration/titer is greater than or equal to the assay cut-off defined in Table 7.

  Note: Due to ongoing re-validation of all assays, these cut-offs may be subject to change.
- A seroprotected subject is a subject whose antibody concentration/titer is greater than or equal to the level defining clinical protection. The following seroprotection thresholds are applicable:
  - Anti-diphtheria antibody concentrations ≥ 0.1 IU/mL.
  - Anti-tetanus antibody concentrations ≥ 0.1 IU/mL.
  - Anti-HBs antibody concentrations ≥ 10 mIU/mL.
  - Anti-poliovirus types 1, 2 and 3 antibody titers ≥ 8.
  - Anti-PRP antibody concentrations ≥ 0.15 µg/mL.
- Other cut-offs to be considered:
  - Anti-PRP antibody concentrations ≥ 1.0 µg/mL.

- Anti-diphtheria and anti-tetanus antibody concentrations ≥ 1.0 IU/mL

- Booster responses for anti-PT, anti-FHA and anti-PRN antibodies are defined as:
  - initially seronegative subjects (pre-booster antibody concentration below cut-off: < 5 ELISA EL.U/mL) with an increase of at least four times the cut-off one month after vaccination (post-booster antibody concentration ≥20 EL.U/mL), and
  - initially seropositive subjects with pre-booster antibody concentration ≥ 5 EL.U./mL and < 20 EL.U/mL with an increase of at least four times the pre-booster antibody concentration one month after vaccination, and,
  - For initially seropositive subjects with pre-booster antibody concentration ≥ 20 EL.U/mL with an increase of at least two times the pre-booster antibody concentration, one month after vaccination.

  Note: Due to ongoing re-validation of pertussis assays, the definition of booster responses may be subject to change.

- The GMC/GMT calculations will be performed by taking the anti-log of the mean of the $\log_{10}$ titer/ concentration transformations. Antibody titers/concentrations below the cut-off of the assay will be given an arbitrary value of half the cut-off for the purpose of GMC/GMT calculation.

Handling of missing data:

Immunogenicity:

- For a given subject and a given immunogenicity measurement, missing or non-evaluable measurements will not be replaced.

Safety/reactogenicity:

- For a given subject and the analysis of solicited symptom within 4 days post-vaccination, missing or non-evaluable measurements will not be replaced. Therefore the analysis of the solicited symptoms based on the Total Vaccinated cohort will include only vaccinated subjects and doses with documented safety data (i.e. symptom screen completed).
- For analysis of unsolicited adverse events, such as serious adverse events or adverse events by primary MedDRA term, and for the analysis of concomitant medications, all vaccinated subjects will be considered. Subjects who did not report the event or the concomitant medication will be considered as subjects without the event or the concomitant medication respectively.
- For summaries reporting both solicited and unsolicited adverse events, all vaccinated subjects will be considered. Subjects for whom the event will not be reported will be considered as subjects without the event.

10.6. Final analysis of the Epoch 001

10.6.1. Analysis of demographics

Demographic characteristics (age [weeks], gender, geographical ancestry, height in length [cm], weight [kg] at first dose, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status will be summarised by group using descriptive statistics:

- Frequency tables will be generated for categorical variables such as center;
- Mean, median and standard error will be provided for continuous data such as age.

The distribution of subjects enrolled among the study sites will be tabulated as a whole and per group.

10.6.2. Analysis of immunogenicity

The primary analysis will be based on the primary ATP cohort for immunogenicity. An analysis on the primary Total Vaccinated cohort will be performed only if, in any vaccine group and at any time point, more than 5% of the vaccinated subjects with immunological data post-dose 3 are excluded from the primary ATP cohort for immunogenicity.

The following section describes the analyses that will be performed.

10.6.2.1. Within group assessment

For each group, one month post-dose 3 and for each assay for which a serological result is available:

- Seropositivity and seroprotection rates with exact 95% CIs will be calculated.
- GMCs/GMTs with 95% CIs will be tabulated.
- For D,T and pertussis antigens, additional summaries will be provided according to the Tdap vaccination history of mother during pregnancy.

For each antigen, antibody concentration or titer distribution one month post-vaccination will be tabulated and displayed using reverse cumulative curves (RCCs).

10.6.2.2. Between group assessment

At one month post-dose 3,

- The asymptotic standardized 95% CI for the group difference in the seropositivity/ seroprotection rates will be computed for each antigen.
- The 95% CI for each group GMC/GMT ratio will be computed using an Analysis of Variance (ANOVA) model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of

Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis b at birth vaccine dose status will also be used as regressor.

10.6.2.3. Interpretation of analyses

Except for analyses addressing criteria specified in the primary objective, comparative analyses will be descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses should not be interpreted for formal conclusions since there is no adjustment for multiplicity of endpoints.

10.6.3. Analysis of safety

The primary analysis will be based on the primary Total Vaccinated cohort. If, in any vaccine group and at any time point of the Epoch 001, the percentage of vaccinated subjects excluded from the primary ATP cohort for safety is more than 5%, a second analysis based on the primary ATP cohort for safety will be performed to complement the primary Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) or 31-day (Days 0-30) follow-up period will be tabulated after each vaccine dose and overall (for the Epoch 001) with exact 95% CI.
- The percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 4-day or 31-day follow-up period will be tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses with local AEs (solicited and unsolicited) will be calculated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines, as well as overall (all sites considered).
- The percentage of subjects/doses reporting each individual solicited local and general AE during the 4-day follow-up period will be tabulated for each group as follows:
  - Over the primary doses, the percentage of subjects with the symptom and its exact 95% CI.
  - Over the primary doses, the percentage of doses with the symptom and its exact 95% CI.
  - At each study dose, the percentage of subjects with the symptom and its exact 95% CI.

  The exact 95% CIs will be calculated assuming independence between doses.
- All computations mentioned above will be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit.

- For fever, analyses will be performed by 0.5°C increments.
- The percentage of subjects/doses with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination will be tabulated after each dose and over the Epoch 001.
- The verbatim reports of unsolicited AEs will be reviewed by a clinical development manager and the signs and symptoms will be coded according to MedDRA. Every verbatim term will be matched with the appropriate Preferred Term. The percentage of subjects/doses with unsolicited AEs occurring within 31 days with exact 95% CI will be tabulated by Preferred Term. Similar tabulations will be done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to 6 months after the last primary vaccination will be tabulated by Preferred Term.
- Subjects who experienced at least one SAE reported before the database lock for the Epoch 001 analysis with an onset date in the Epoch 001 will be reported and the SAE will be described in detail.

10.7. Final analysis of the Epoch 002

10.7.1. Analysis of demographics/baseline characteristics

Demographic characteristics (age in months at Visit 5) and withdrawal status will be summarized by group using descriptive statistics:

- Frequency tables will be generated for categorical variables such as race/ethnicity;
- Mean, median and standard error will be provided for continuous data such as age.

The distribution of subjects vaccinated at Visit 5 among the study sites will be tabulated as a whole and per group.

For enrolled subjects that do not participate in the Epoch 002, the reason for not participating will be summarized.

10.7.2. Analysis of immunogenicity

The primary analysis will be based on the booster ATP cohort for immunogenicity. An analysis on the booster Total Vaccinated cohort will be performed only if, in any vaccine group and at any time point of the Epoch 002, more than 5% of the vaccinated subjects with immunological data are excluded from the booster ATP cohort for immunogenicity.

The following section describes the analyses that will be performed.

10.7.2.1. Within group assessment

For each group, prior to the booster dose and one month post-booster dose and for each assay for which a serological result is available:

- Seropositivity and seroprotection rates and booster response rates for pertussis with exact 95% CIs will be calculated.
- GMCs/GMTs with 95% CIs will be tabulated.

For D,T and pertussis antigens, additional summaries will be provided according to the Tdap vaccination history of mother during pregnancy.

For each antigen, antibody concentration or titer distribution before and one month Post-booster (when available) will be tabulated and displayed using RCCs.

10.7.2.2. Between group assessment

At pre-booster and at one month post-booster,

- The asymptotic standardized 95% CI for the group difference in the seroprotection/ seropositivity rates will be computed for each antigen.
- The 95% CI for each group GMC/GMT ratio will be computed using an ANOVA model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B at birth vaccine dose status will also be used as regressor.

10.7.2.3. Interpretation of analyses

In Epoch 002, all comparative analyses will be descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses should not be interpreted for formal conclusions since there is no adjustment for multiplicity of endpoints.

10.7.3. Analysis of safety

The primary analysis for the Epoch 002 will be based on the booster Total Vaccinated cohort and will only look at the booster dose. If, in any vaccine group, the percentage of vaccinated subjects excluded from the booster ATP cohort for safety is more than 5%, a second analysis based on the booster ATP cohort for safety will be performed to complement the booster Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period after the booster dose, will be tabulated with exact 95% CI for each group.

CONFIDENTIAL

- The incidence of local AEs (solicited and unsolicited) will be calculated at each injection site as well as overall (all sites considered) for each group.
- The percentage of subjects reporting each individual solicited local and general AE during the 4-day follow-up period will be tabulated with its exact 95% CI for each group.
- All computations mentioned above will be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit.
- For fever, analyses will be performed by 0.5°C increments.
- The percentage of subjects with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination will be tabulated for each group.
- The verbatim reports of unsolicited AEs will be reviewed by a clinical development manager and the signs and symptoms will be coded according to MedDRA. Every verbatim term will be matched with the appropriate Preferred Term. The percentage of subjects with unsolicited AEs occurring within 31 days following the booster dose with its exact 95% CI will be tabulated by Preferred Term. Similar tabulations will be done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.

Additionally,

- Any large injection site reaction (defined as a swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase in limb circumference) reported within 4 days (Days 0-3) following the booster dose will be described in detail.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from booster dose up to one month after booster vaccination will be tabulated by Preferred Term.
- Subjects who experienced at least one SAE from the booster dose to study end will be reported and the SAEs will be described in detail.

10.8. Statistical methods

- The exact CIs for a proportion within a group will be calculated from Proc StatXact [Clopper, 1934].
- The standardized asymptotic CI for the group difference in proportion is the method implemented in Proc StatXact 7.0. It corresponds to method 6 in the Newcombe paper [Newcombe, 1998].
- The CI for GMTs/GMCs will be obtained within each group separately. The CI for the mean of log-transformed titer/concentration will be first obtained assuming that log-transformed values were normally distributed with unknown variance. The CI for

the GMTs/GMCs will then be obtained by exponential-transformation of the CI for the mean of log-transformed titer/concentration.

- The GMT/GMC group ratio will be obtained using an ANOVA model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B status at birth vaccine dose will also be used as regressor. The GMC/GMT group ratio and its CI will be derived as exponential-transformation of the corresponding group contrast in the model.

10.9. Conduct of analyses

Any deviation(s) or change(s) from the original statistical plan outlined in this protocol will be described and justified in the final study report.

10.9.1. Sequence of analyses

(Amendment 2: 17 April 2015)

The analyses will be performed ***stepwise***:

1. ***A partial analysis of Epoch 001 up to one month after the third primary vaccine dose will be conducted. This analysis will include the final analysis of anti-PRP, solicited and unsolicited symptoms on data as clean as possible. This analysis will be displayed on GSK clinical trial registry as soon as possible.***
2. ***The final data analysis of the study covering both the epochs will be conducted at the end of the study. All these analyses will be presented in a final clinical study report.***

10.9.2. Statistical considerations for interim analyses

All analyses will be conducted on final data and therefore no statistical adjustment for interim analyses is required.

11. ADMINISTRATIVE MATTERS

To comply with ICH GCP administrative obligations relating to data collection, monitoring, archiving data, audits, confidentiality and publications must be fulfilled.

11.1. Remote Data Entry instructions

RDE, a validated computer application, will be used as the method for data collection.

In all cases, subject initials will not be collected nor transmitted to GSK. Subject data necessary for analysis and reporting will be entered/transmitted into a validated database or data system. Clinical data management will be performed in accordance with applicable GSK standards and data cleaning procedures.

While completed eCRFs are reviewed by a GSK Biologicals' Site Monitor at the study site, omissions or inconsistencies detected by subsequent eCRF review may necessitate clarification or correction of omissions or inconsistencies with documentation and approval by the investigator or appropriately qualified designee. In all cases, the investigator remains accountable for the study data.

The investigator will be provided with a CD-ROM of the final version of the data generated at the investigational site once the database is archived and the study report is complete and approved by all parties.

11.2. Study Monitoring by GSK Biologicals

GSK will monitor the study to verify that, amongst others, the:

- Data are authentic, accurate, and complete.
- Safety and rights of subjects are being protected.
- Study is conducted in accordance with the currently approved protocol, any other study agreements, GCP and all applicable regulatory requirements.

The investigator and the head of the medical institution (where applicable) agrees to allow the monitor direct access to all relevant documents.

The investigator must ensure provision of reasonable time, space and qualified personnel for monitoring visits.

Direct access to all study-site related and source data is mandatory for the purpose of monitoring review. The monitor will perform a RDE review and a Source Document Verification (SDV). By SDV we understand verifying RDE entries by comparing them with the source data that will be made available by the investigator for this purpose.

The Source Documentation Agreement Form describes the source data for the different data in the RDE. This document should be completed and signed by the site monitor and investigator and should be filed in the monitor's and investigator's study file. Any data item for which the RDE will serve as the source must be identified, agreed and documented in the source documentation agreement form.

For RDE, the monitor will mark completed and approved screens at each visit.

Upon completion or premature discontinuation of the study, the monitor will conduct site closure activities with the investigator or site staff, as appropriate, in accordance with applicable regulations, GCP, and GSK procedures.

11.3. Record retention

Following closure of the study, the investigator must maintain all site study records (except for those required by local regulations to be maintained elsewhere) in a safe and secure location. The records must be easily accessible, when needed (e.g. audit or inspection), and must be available for review in conjunction with assessment of the facility, supporting systems, and staff. Where permitted by applicable laws/regulations or

institutional policy, some or all of these records can be maintained in a validated format other than hard copy (e.g. microfiche, scanned, electronic); however, caution needs to be exercised before such action is taken. The investigator must ensure that all reproductions are legible and are a true and accurate copy of the original and meet accessibility and retrieval standards, including re-generating a hard copy, if required. Furthermore, the investigator must ensure that an acceptable back-up of the reproductions exists and that there is an acceptable quality control procedure in place for making these reproductions.

GSK will inform the investigator/institution of the time period for retaining these records to comply with all applicable regulatory requirements. However, the investigator/institution should seek the written approval of the sponsor before proceeding with the disposal of these records. The minimum retention time will meet the strictest standard applicable to a particular site, as dictated by ICH GCP, any institutional requirements, applicable laws or regulations, or GSK standards/procedures; otherwise, the minimum retention period will default to 15 years.

The investigator/institution must notify GSK of any changes in the archival arrangements, including, but not limited to archival at an off-site facility, transfer of ownership of the records in the event the investigator leaves the site.

11.4. Quality assurance

To ensure compliance with GCP and all applicable regulatory requirements, GSK may conduct a quality assurance audit. Regulatory agencies may also conduct a regulatory inspection of this study. Such audits/inspections can occur at any time during or after completion of the study. If an audit or inspection occurs, the investigator and institution agree to allow the auditor/inspector direct access to all relevant documents and to allocate his/her time and the time of his/her staff to the auditor/inspector to discuss findings and any relevant issues.

11.5. Posting of information on publicly available clinical trial registers and publication policy

Study information from this protocol will be posted on publicly available clinical trial registers before enrolment of subjects begins.

Summaries of the results of GSK interventional studies (phase I-IV) are posted on publicly available results registers within 12 months of the primary completion date for studies of authorized vaccines and 18 months for studies of non-authorized vaccines.

GSK also aims to publish the results of these studies in the searchable, peer reviewed scientific literature. Manuscripts are submitted for publication within 24 months of the last subject's last visit.

11.6. Provision of study results to investigators

Where required by applicable regulatory requirements, an investigator signatory will be identified for the approval of the study report. The investigator will be provided reasonable access to statistical tables, figures, and relevant reports and will have the

opportunity to review the complete study results at a GSK site or other mutually-agreeable location.

GSK Biologicals will also provide the investigator with the full summary of the study results. The investigator is encouraged to share the summary results with the study subjects, as appropriate.

12. COUNTRY SPECIFIC REQUIREMENTS

Not applicable.

APPENDIX B AMENDMENTS AND ADMINISTRATIVE CHANGES TO THE PROTOCOL

GlaxoSmithKline Biologicals

Clinical Research & Development

Protocol Amendment 1

eTrack study number and Abbreviated Title	117119 (DTPA-HBV-IPV-135)
IND number	BB-IND 006687
EudraCT number	2013-004304-19
Amendment number:	Amendment 1
Amendment date:	Final: 18 September 2014
Co-ordinating author:	PPD Scientific Writer

Rationale/background for changes:

- Clarification has been provided that large injection site reactions and measurement of the injected limb should be collected as a solicited symptom. Specific instructions regarding measurement of limb circumference and clinical details of large injection site reactions have been added.
- Additional minor clarifications of study procedures and data analyses have been made throughout the document.
- Instructions regarding interval between preparation and administration of vaccine has been aligned with the stability data described in the current Investigator Brochure.
- Due to ongoing re-validation of serological assays for antibodies to diphtheria and tetanus toxoids, pertussis antigens, poliovirus, hepatitis B surface antigen and polyribosyl ribitol phosphate, the cut-offs for these assays could potentially change and hence a note has been added in the protocol regarding this. The definition of booster response to pertussis antigens could also potentially be revised.
- Sequence of reporting the results has been clarified.
- The contributing authors and sponsor signatory were updated to reflect changes in the study team.

Amended text has been included in *bold italics* and deleted text in ~~strikethrough~~ in the following sections:

α Child can still continue in the study if the mother does not wish to provide consent to record her Tdap vaccination history.

β Only the Tdap vaccination history (during the pregnancy of the enrolled child) from mothers who have given consent to provide this information will be obtained and recorded in the eCRF..

δ For the Penta group, which receives only one vaccine at Visit 5, baseline measurement of only the limb receiving the vaccine is required

* Refer to Section 8.1.3.1 ***and 5.6.2.9*** for detailed explanation on the reporting of large injection site reaction

Section 5.6.2.4 Vaccination history

The Tdap vaccination history of the mother during pregnancy will also be collected and recorded in the eCRF ***(provided that the mother has consented to provide this information).***

Note: Maternal vaccination is requested in order to be able to summarize the responses of the subjects to pertussis antigens according to whether or not the mothers received a pertussis vaccine during their pregnancy. This information will aid in understanding the effect of transplacentally transferred antibodies on the childs' immune response to vaccination.

Section 5.6.2.9.1 Blood sampling for immune response assessments

- A volume of approximately 5.0 mL of whole blood ~~(~~to provide approximately 1.7 mL of serum~~)~~ should be drawn from all subjects for the analysis of humoral immune response at Visits 4 and 5. At least 3.5 mL of whole blood ~~(~~to provide ~~atleast~~ ***approximately*** 1.2 mL of serum~~)~~ should be drawn from all subjects for the analysis of humoral immune response at Visit 6. After centrifugation, serum samples should be kept at –20°C/ –4°F or below until shipment. Refer to the SPM for more details on sample storage conditions.

Section 5.6.2.11 Baseline measurement of limb length and circumference after booster vaccination at visit 5

During Epoch 002, baseline measurement of length of limb(s) and circumference (arms or legs according to where the vaccine was administered) at the level of the injection site should be obtained. For the Penta group, baseline measurement is only required for the limb that will be vaccinated. Clothing should be removed so as not to interfere with the measurement of the length of the limb and the circumference. Upper arm length will be determined from the acromion process of the scapula to the tip of the elbow and thigh length will be determined from the midpoint of the abdomen thigh flexure crease and the proximal end of the patella. For measuring upper arm circumference, the measurement will be performed while the arm is held parallel to the trunk and the elbow is flexed in front at 90° (as if the subject is carrying a tray) [Kohl, 2007]. For measuring leg circumference the child should be standing or lying flat, as appropriate, as long as the leg is straight.

Section 5.6.2.13 Recording of AEs, SAEs and NOCDs

- ***During Epoch 002, following the fourth dose vaccination, the parents/LAR(s) should be provided with a measurement device for recording circumference of injected limbs (arms or legs according to where vaccine was administered) at the level of the injection site on the day of vaccination and during the next three days on a diary card. The parents/LAR(s) should be instructed on how and where to perform the measurement of the circumference of the vaccinated limb. Daily measurements should be performed in the same manner preferably by the same person and at the same time of day during the 4-day follow-up (Day 0-Day3) period.***
- ~~During Epoch 002, i~~***If*** the parent(s) /LAR(s) of infants observe any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of ~~arm~~ ***limb*** circumference) during the 4-day follow-up (Day 0-Day 3) period, they ~~will be asked~~ ***are*** to contact study personnel and to visit the investigator's office for evaluation as soon as possible ***and to bring the diary card with them.*** ~~. The investigator will record detailed information describing the AE on a specific large injection site reaction in the eCRF.~~
- ***In addition to the diameter of the swelling and the circumference of the limb that are reported as solicited symptoms, the parents(s)/LAR(s) will record the following additional symptoms/characteristics that may be associated with large injection site swelling reactions on the diary card:***
  - ***Type of swelling (local swelling only around the injection site, diffuse swelling not involving the elbow or knee joint, swelling involving the elbow or knee joint)***
  - ***Whether or not the diameter of the swelling involves more than 50% of the limb (baseline measurement of the length of the limb taken by study personnel at the vaccination visit will be provided on the diary cards)***
  - ***Induration at injection site (largest diameter)***
  - ***Pruritis at the injection site (intensity – scale provided)***
  - ***Functional impairment (intensity – scale and description provided)***
- ***The study personnel's evaluation will be recorded in the medical chart. In case the diary card score is not in line with the medical chart score, the medical chart will indicate what is the most intense score. The largest or most intense score for a given day will be recorded in the eCRF at the level of the solicited symptoms and at the level of the large swelling report form.***

CONFIDENTIAL

Section 5.7.3 Laboratory assays

At Visits 4, 5 and 6, blood will be collected for measurement of immune response. Total blood volume to be taken from each subject over the study period is approximately 13.5 mL (approximately 5.0 mL of whole blood ***to provide approximately 1.7 mL of serum*** at Visits 4 and 5 and at least 3.5 mL of whole blood ***to provide approximately 1.2 mL of serum*** at Visit 6).

Section 6.1 Description of study vaccines

Table 9 Study vaccines

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Pentacel	DTaP-IPV (Sanofi Pasteur)	PT=20µg; FHA=20µg; FIM=5µg; PRN=3µg; DT=15Lf; TT=5Lf; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; PRP=10µg TT,TT=24µg; $AlPO_4$=330µg Al3+	Suspension for injection (0.5-mL dose) supplied as a liquid vaccine component in a single dose vial	0.5 mL*	4
	~~ActHIB~~ ***Hib***	~~Hib=10µg TT, TT=24µg~~ ***PRP=10µG; TT~=25µG***	~~White lyophilized pellet in a single dose vial, it must be reconstituted before use with the liquid DTaP- IPV component.~~ ***The lyophilized Hib component is presented as a white pellet in a glass vial; it must be reconstituted with the liquid DTaP-IPV component before use***		

Section 6.3 Dosage and administration of study vaccines

NOTE: After reconstitution, *Infanrix hexa* should be ~~administered promptly or stored refrigerated between 2° and 8°C and administered within 24 hours. If the vaccine is not administered promptly, shake the solution vigorously again before injection~~ ***injected immediately. However the vaccine may be kept for up to 8 hours at room temperature (21°C).***

Section 6.7.1 Recording of concomitant medications/products and concomitant vaccination

- Any concomitant vaccination administered ***since birth*** ~~in the period starting 30 days before the first dose of the study vaccine~~ and ending 30 days after the booster dose (Visit 6). ~~Notes: 1).~~ Vaccinations listed prior to the first dose of study vaccine are to be recorded as vaccination history. ~~2)~~ The fourth dose of *Prevnar 13* will be recorded as concomitant vaccination.

  * ***Refer to those*** SAEs that are required to be reported per protocol.

CONFIDENTIAL

Section 8.1.3.1 Solicited local (injection-site) adverse events

Table 11 Solicited local adverse events

Pain at injection site
Redness at injection site
Swelling at injection site
Post-dose 4 measurements of circumference of limbs (arm or leg according to where vaccine was administered)

N.B. If parent(s) /LAR(s) of infants observe any large injection site reaction (defined as swelling with a diameter > 50 mm, noticeable diffuse swelling or noticeable increase of ~~arm~~ ***limb*** circumference) after the booster dose at Visit 5, they ~~will be asked~~ ***are*** to contact study personnel and to visit the investigator's office for evaluation as soon as possible ***and bring the diary card with them***. The investigator will record detailed information describing the AE on a specific large injection site reaction ***form*** in the eCRF. ***In addition to the diameter of the swelling and the circumference of the limb that are reported as solicited symptoms the parent(s)/LAR(s) will need to record additional symptoms/characteristics as mentioned in Section 5.6.2.13.***

Note: local AEs will not be ~~collected~~ ***solicited*** for co-administered vaccines like *Prevnar 13* ~~and *Rotarix*~~.

Section 8.3.1 Time period for detecting and recording adverse events and serious adverse events

Note: With the exception of AEs/SAEs leading to withdrawal, study participation and concurrent GSK medications or vaccines, there is no reporting of SAEs from the time of the Epoch 1 ESFU phone contact and administration of dose 4 (approximately three months).

Section 8.3.3.2.1 Assessment of intensity

Table 14 Intensity scales for solicited symptoms in infants/toddlers

Infant/Toddler (15–24 months)		
Adverse Event	**Intensity grade**	**Parameter**
Pain at injection site	0	None
	1	Mild: Minor reaction to touch
	2	Moderate: Cries/protests on touch
	3	Severe: Cries when limb is moved/spontaneously painful
Redness at injection site		Record greatest surface diameter in mm
Swelling at injection site		Record greatest surface diameter in mm
Increase in limb circumference post-dose 4 (arm or leg according to where vaccine was administered)		***Record the limb circumference at the level of the injection site***

The maximum intensity of fever ~~was~~ ***will be*** scored at GSK Biologicals as follows:

0	=	***<100.4°F***	***<38.0°C***
1	=	***≥100.4°F to ≤102.2°F***	***≥38.0°C to ≤39.0°C***
2	=	***>102.2°F to ≤104.0°F***	***>39.0°C to ≤40.0°C***
3	=	***> 104.0°F***	***> 40.0°C***

CONFIDENTIAL

Prior to analysis, the increase in limb circumference of each limb as compared to the baseline pre-vaccination measurement will be scored for each subject at GSK Biologicals' as follows:

Grade 0 = Increase in limb circumference ≤5 mm
1 = Increase in limb circumference >5 mm but ≤20 mm
2 = Increase in limb circumference >20 mm but ≤40 mm
3 = Increase in limb circumference >40 mm

For unsolicited symptoms and adverse events associated with large injection site reactions (e.g. pruritus, induration and functional impairment, t~~T~~he intensity should be assigned to one of the following categories:

Section 10.4.2 Primary ATP cohort for analysis of safety

- who have received all ***planned*** study vaccines ~~as planned~~ ***for each completed vaccination visit in*** ~~up to the end of~~ Epoch 001;

Section 10.4.5 Booster ATP cohort for analysis of safety

- who have received the ***planned*** booster dose at 15-18 months of age;

Section 10.5 Derived and transformed data

- A seropositive subject is a subject whose antibody concentration/titer is greater than or equal to the assay cut-off defined in Table 7.
  Note: Due to ongoing re-validation of all assays, these cut-offs may be subject to change.
- Booster responses for anti-PT, anti-FHA and anti-PRN antibodies are defined as:
  – For initially seropositive subjects with pre-booster antibody concentration ≥ 20 EL.U/mL with an increase of at least two times the pre-booster antibody concentration, one month after vaccination.

  Note: Due to ongoing re-validation of pertussis assays, the definition of booster responses may be subject to change.

Section 10.6.2.2 Between group assessment

- The 95% CI for each group GMC/GMT ratio will be computed using an Analysis of Variance (ANOVA) model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect ***and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model***.. For hepatitis B antigen, the hepatitis b at birth vaccine dose status will also be used as regressor ~~leading to an Analysis of Co-variance (ANCOVA) model~~.

Section 10.7.2.2 Between group assessments

- The 95% CI for each group GMC/GMT ratio will be computed using an ANOVA model on the logarithm-transformed concentrations/titers. The ANOVA model will include the vaccine group as fixed effect ***and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model***. For hepatitis B antigen, the hepatitis B at birth vaccine dose status will also be used as regressor ~~leading to an ANCOVA model.~~

CONFIDENTIAL

Section 10.8 Statistical methods

- The GMT/GMC group ratio will be obtained using an ANOVA model on the logarithm-transformed concentrations/titers. ***The ANOVA model will include the vaccine group as fixed effect and the DTP vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model.*** For hepatitis B antigen, the hepatitis B status at birth vaccine dose will also be used as regressor ~~leading to an Analysis of Co-variance (ANCOVA) model~~.

Section 10.9.1 Sequence of analyses

1. The final data analysis of Epoch 001 including all as clean as possible data, up to one month after the third primary vaccine dose, and some partial data from the ESFU contact will be conducted as soon as possible. This analysis will include the final analysis of immunogenicity and the final analysis of solicited symptoms for the primary vaccination course. ~~All analyses will be presented in Clinical Study Report (CSR). The CSR will be shared with the investigators.~~

2. All these analyses will be presented in a~~n Epoch 002 specific~~ ***final*** CSR. ~~The final CSR will be shared with the investigators.~~

Protocol Amendment 2

eTrack study number and Abbreviated Title	117119 (DTPA-HBV-IPV-135)
IND number	BB-IND 006687
EudraCT number	2013-004304-19
Amendment number:	Amendment 2
Amendment date:	Final Version 02: 17 April 2015
Co-ordinating author:	PPD Scientific Writer

Rationale/background for changes:
The amendment 2 has been implemented to amend the following sections of the protocol:

- The assay for testing antibodies against polyribosyl ribitol phosphate (anti-PRP) has been re-developed but is not yet qualified or validated for testing the one month post dose-3 samples. This has been clarified in the protocol in Table 7 Humoral immunity (antibody determination) and Section 5.7.3 Laboratory assays.
- Investigator sign-off on the patient identification (PIDS) will be done after Visit 4 instead of extended safety follow-up (ESFU). In Table 4 List of study procedures, the bullets pertaining to investigator sign-off and analysis of Epoch 001 has been removed from the ESFU visit and retained at Visit 4 to reflect this change.
- The collection of baseline measurement of limb length has been removed since it will not be used in analysis; only limb circumference will be used in analysis. Accordingly, text related to this has been amended in Table 4 List of study procedures, Sections 5.6.2.11, Baseline measurement of limb circumference after booster vaccination at visit 5 and 5.6.2.13 Recording of AEs, SAEs and NOCDs.
- Errors in the vaccines dictionary of Study Master Repository (SMR) have been rectified for *Infanrix hexa*, *Pediarix* and *Pentacel* vaccines. The corresponding correction has been made in Table 9 Study vaccines.
- The sequence of analysis in Section 10.9.1 Sequence of analyses, has been amended to reflect that there will first be an analysis of immunogencity for anti-PRP and safety for Epoch 001, followed by a final analysis covering both Epochs at the end of the study.

Amended text has been included in *bold italics* and deleted text in ~~strikethrough~~ in the following sections:

CONFIDENTIAL

CONFIDENTIAL

In Section 5.6.2.11 Baseline measurement of limb circumference after booster vaccination at visit 5

In Section 5.6.2.11 Baseline measurement of limb ~~length and~~ circumference after booster vaccination at visit 5

During Epoch 002, baseline measurement of ~~length of~~ limb~~(s) and~~ circumference (arms or legs according to where the vaccine was administered) at the level of the injection site should be obtained. For the Penta group, baseline measurement is only required for the limb that will be vaccinated. Clothing should be removed so as not to interfere with the measurement of the ~~length of the~~ limb ~~and the~~ circumference. ~~Upper arm length will be determined from the acromion process of the scapula to the tip of the elbow and thigh length will be determined from the midpoint of the abdomen thigh flexure crease and the proximal end of the patella.~~

In Section 5.6.2.13 Recording of AEs, SAEs and NOCDs:

- ~~Whether or not the diameter of the swelling involves more than 50% of the limb (baseline measurement of the length of the limb taken by study personnel at the vaccination visit will be provided on the diary cards).~~

In Section 5.7.3 Laboratory assays

All serology will be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized ~~validated~~ procedures with adequate controls. ***All serology for primary endpoints will be determined in GSK Biologicals' laboratories, or in a laboratory designated by GSK, using standardized, validated procedures with adequate controls.***

System	Component	Method	Test kit/ Manufacturer	Unit	Cut-off†	Laboratory**
Serum	Haemophilus influenzae type b.Polyribosyl Ribitol Phosphate Ab ‡	**ELISA**	**In-house***	**µg/mL**	**0.15**	**GSK Biologicals§**

‡For anti-PRP post-dose 3, the assay is not yet qualified or validated.

Section 6.1 Description of study vaccines

Table 9 Study vaccines

Treatment name	Vaccine/ Product name	Formulation	Presentation	Volume	Number of doses
Infanrix hexa	DTPa-HBV-IPV	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=***32DU***; Aluminium=700µg Al3+	The DTPa-HBV-IPV component is presented as a turbid white suspension in a pre-filled syringe.	full volume^	3
Pediarix	DTPa-HBV-IPV	DT>=30IU; TT>=40IU; PT=25µg; FHA=25µg; PRN=8µg; HBsAg=10µg; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=***32DU***; Aluminium=700µg Al3+	The DTPa-HBV-IPV component is presented as a turbid white suspension in a pre-filled syringe.	0.5 mL	3
Pentacel	DTaP-IPV (Sanofi Pasteur)	PT=20µg; FHA=20µg; FIM=5µg; PRN=3µg; DT=15Lf; TT=5Lf; Inactivated Poliovirus type 1 (Mahoney strain)=40DU; Inactivated Poliovirus type 2 (MEF-1 strain)=8DU; Inactivated Poliovirus type 3 (Saukett strain)=32DU; PRP=10µg TT,TT=24µg; $AlPO_4$=330µg Al3+	Suspension for injection (0.5-mL dose) supplied as a liquid vaccine component in a single dose vial***. The lyophilized Hib component is presented as a white pellet in a separate glass vial. It must be reconstituted with the liquid DTaP-IPV component before use.***	0.5 mL*	4
	~~Hib~~	~~PRP=10µG; TT~=25µG~~			

Section 10.9.1 Sequence of analyses

The analyses will be performed ***stepwise*** ~~in 2 steps~~:

~~**1.** The final data analysis of Epoch 001 including all as clean as possible data, up to one month after the third primary vaccine dose, and some partial data from the ESFU contact will be conducted as soon as possible. This analysis will include the final analysis of immunogenicity and the final analysis of solicited symptoms for the primary vaccination course.~~ ***A partial analysis of Epoch 001 up to one month after the third primary vaccine dose will be conducted. This analysis will include the final analysis of anti-PRP, solicited and unsolicited symptoms on data as clean as possible. This analysis will be displayed on GSK clinical trial registry as soon as possible.***

2. ~~The final data analysis of Epoch 002 will be conducted subsequently. This analysis will include final analysis of the ESFU from Epoch 001 and the final analysis of immunogenicity and safety from Epoch 002. All these analyses will be presented in a final CSR~~. ***The final data analysis of the study covering both the epochs will be conducted at the end of the study. All these analyses will be presented in a final clinical study report.***

DTPA-HBV-IPV-135 (117119): ELIGIBILITY CHECK (Eligibility)

ELIGIBILITY CHECK

1.* ✔ Did the subject meet all the entry criteria?
[Eligible]

[ELIGIBIL]

[A:Y] ◯ Yes

[A:N] ◯ **[INCL_EXCL_CRITERIA]**

No -> Tick all boxes corresponding to violations of any inclusion/exclusion criteria.

Do not enter the subject into the study if he/she failed any of the inclusion or exclusion criteria below.

[INCL_CRITERIA]

INCLUSION CRITERIA

Tick the boxes corresponding to any of the inclusion criteria the subject failed.

[A:1]	☐	1.Subjects' parent(s)/Legally Acceptable Representative(s) [LAR(s)] who, in the opinion of the investigator, can and will comply with the requirements of the protocol (e.g. completion of the diary cards, return for follow-up visits).
[A:2]	☐	2. A male or female between, and including, 6 and 12 weeks of age at the time of first vaccination.
[A:3]	☐	3. Born full-term (i.e. after a gestation period of 37 weeks to less than 42 completed weeks [259 to 293 days]).
[A:4]	☐	4. Written informed consent obtained from the parent(s)/LAR(s) of the subject
[A:5]	☐	5. Healthy subjects as established by medical history and clinical examination before entering into the study.
[A:6]	☐	6. Infants who have not received a previous dose of hepatitis B vaccine or those who have received only 1 dose of hepatitis B vaccine administered at least 30 days prior to enrolment.

[EXCL_CRITERIA]

EXCLUSION CRITERIA

Tick the boxes corresponding to any of the exclusion criteria that disqualified the subject from entry.

[A:7]	☐	7. Child in care
[A:8]	☐	8. Use of any investigational or non-registered product (drug or vaccine) other than the study vaccines within 30 days preceding the first dose of study vaccines, or planned use during the study period
[A:9]	☐	9. Chronic administration (defined as more than 14 days in total) of immunosupp. or other immune-modifying drugs since birth. (For corticosteroids, this will mean prednisone > or = 0.5 mg/kg/day, or equivalent). Inhaled and topical steroids are allowed.
[A:10]	☐	10. Planed adm/adm of vac not forseen by prot 30d before dose1 till 30d after dose3 & 30d before/after booster. Inactiv. flu & HepA vac allowed. Rout.admin. of MMR, varicella, pneumo vac allowed 30d after last pri vacc till 30d before Bst&post-bst samplng
[A:11]	☐	11. Concurrently participating in another clinical study, at any time during the study period, in which the subject has been or will be exposed to an investigational or a non-investigational product (pharmaceutical product or device).
[A:12]	☐	12. History of Hib, diphtheria, tetanus, pertussis, pneumococcal, rotavirus, poliovirus and hepatitis B diseases.
[A:13]	☐	13. Previous vaccination against Hib, diphtheria, tetanus, pertussis, pneumococcus, rotavirus and/or poliovirus; more than one previous dose of hepatitis B vaccine.
[A:14]	☐	14. Any confirmed or suspected immunosuppressive or immunodeficient condition, based on medical history and physical examination (no laboratory testing required).
[A:15]	☐	15. Family history of congenital or hereditary immunodeficiency.
[A:16]	☐	16. History of any reaction or hypersensitivity likely to be exacerbated by any component of the vaccines (including yeast).
[A:17]	☐	17. Hypersensitivity to latex.

PPD

	[A:18]	☐	18. Major congenital defects or serious chronic illness.
	[A:19]	☐	19. History of any neurological disorders including seizures.
	[A:20]	☐	20. Administration of immunoglobulins and/or any blood products since birth or planned administration during the study period.
	[A:21]	☐	21. History of intussusception or of any uncorrected congenital malformation of the gastrointestinal tract that would predispose the infant to intussusception.
	[A:22]	☐	22. History of Severe Combined Immunodeficiency Disease (SCID).
	[A:23]	☐	23. Acute disease and/or fever at time of enrol.– Fever: temp>or=38.0°C /100.4°F by any rout. Pref route: rectal for pri & axilary for bst. Sub. with minor illnes (eg: mild diar, mild uper resp.infection) with no fever may be enrol. at discretion of INV

DTPA-HBV-IPV-135 (117119): SERIOUS ADVERSE EVENTS (SAE) - Repeating Form

#	SAE Report No.	Did SAE occur after initiation of study medication?	SERIOUS ADVERSE EVENT	Seriousness	RELEVANT CONCOMITANT/TREATMENT MEDICATIONS/VACCINATIONS	RELEVANT MEDICAL CONDITIONS/RISK FACTORS	RELEVANT DIAGNOSTIC RESULTS	Relevant diagnostic results not noted on the left columns	General narrative comments
1									

If you wish to record a new SAE please determine if the new SAE is clinically or temporally related to an SAE previously entered on this form.
If yes, record the details below using the 'Add Entry' button in this form.
If not clinically or temporally related, create a new SAE form for this subject by clicking on the 'New' button at the top of the page.
Do not record pre and post randomization events on the same form.

SAE REPORT NO.

1. ✔ SAE Report No. *[read-only]*

RANDOMIZATION

2.* Did the event occur after initiation of investigational product(s)?
[Did SAE occur after initiation of study medication?]
[rdcSAERAND]
[A:N] ○ No
[A:Y] ○ Yes

	No.	Event	Start date and time	Outcome / End date and time	Maximum Intensity	Action taken with investigational product(s) as a result of the event	Did the subject withdraw from study due to this event?	Is there a reasonable possibility that the event may have been caused by the investigational product(s)?	Was the AE caused by activities related to study participation other than investigational product?	Medically attended visit
3. ✔										

SERIOUS ADVERSE EVENT Entry

Use the 'Add Entry' button to enter details of the SAE. For additional SAEs that are clinically or temporally related (e.g., SAEs that occur during the same hospitalization) use the 'Add Entry' button to create a new row for entry of the additional SAE. Enter ONE event per row.

PPD

GENERAL NARRATIVE COMMENTS		
Provide a clear (this narrative will be provided to regulatory authorities) and brief chronological description (with dates) of the clinical course of the event including: - Associated signs and symptoms - Clinical evolution (hospitalisation, outcome, description of sequelae if any, autopsy results, etc.) - Non-drug treatment such as surgery - Other information useful for the medical assessment of the case (e.g. reason for diagnosis if not obvious or if diagnosis changed) - Relevant additional risk factors including family or social history (negative sentence can also be helpful) - Possible cause(s) of the event - Rationale for relationship when SAE is possibly related to study product, concomitant product or study procedure, etc. Complete a new box only when the previous one is full.

|__|__|__|__|__|__|__|__|

To be completed by the Investigator or delegate

***Protocol* 117119**

(DTPA-HBV-IPV-135)

Hexa GROUP- BOOSTER

PLEASE DO NOT FORGET TO BRING BACK THE DIARY CARD AT THE NEXT VISIT

CONFIDENTIAL

General Instructions

Thank you for your child's participation in this clinical trial.

During your child's last study visit, you received a "Diary Card" to fill in every day for a defined period, so that your child's study doctor or the study staff will know your child's general health status after the vaccination.

Here below you will find general instructions on how to complete the "Diary Card". There are also other specific instructions relative to each part of the "Diary Card" that you will need to fill in.

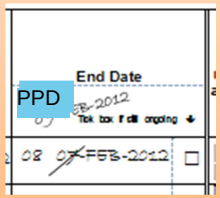
INSTRUCTIONS TO COMPLETE THE "DIARY CARD"

- Write in clearly, use a pen (never pencil).
- The grey areas are dedicated to the investigator or delegate only. Do not write in these areas.

Illness/Sign/Symptom ☑ if at vaccine injection site ↓	Worst Intensity 1/2/3	Start Date	End Date Tick box if still ongoing ↓	Did you receive medical attention?	Type of medical attention To be completed by the investigator or delegate	Relationship to inv. Product To be completed by the investigator or delegate
Tendinitis ☐	2	04-FEB-2012	08-FEB-2012 ☐	☐ No ☒ Yes	HOERMD ☐☐	☐ No ☐ Yes

➢ *HOW TO CORRECT MISTAKES?*

- Cross out the mistake with a single line.
- Don't hide the mistake. Don't use correction fluid or don't make inkblots.
- Write the correct response close to the mistaken one.
- If the correct response is written outside of the box, circle it and point to it with an arrow towards the box.
- **Put your initials near the correction.**
- **Date the correction**



➢ *WHO TO CONTACT IN CASE OF QUESTIONS?*

If you have any questions, please contact your child's study doctor or the study staff on the following phone number:

[insert phone n° of the study doctor or study staff]

Please contact your child's study doctor or the study staff immediately if your child has any symptoms you think are serious.

Instructions to complete:
Local and general symptoms

- If your child experience(s) any other symptoms than those listed in the local symptoms or general symptoms pages, please write these symptoms down in the Adverse Event section.
- If a symptom <u>appears only after</u> day 3, please write this symptom down in the Adverse Event section.

➢ *<u>HOW TO COMPLETE DIARY CARD FOR ANY SYMPTOM "AFTER DAY 3"?</u>*

- In the columns "After day 3", if the symptom is still ongoing* after day 3, tick "Yes". Otherwise, tick "No".

* The symptom is ongoing if after day 3:
- The intensity of the symptom is 1 or higher
- The oral (in the mouth), axillary (under the armpit), tympanic (in the ear) or rectal (in the anus) temperature is higher or equal to 100.4°F.

- If Yes,
  - Please write the worst intensity for pain, the highest temperature or the greatest measurement of Redness or swelling recorded for the respective symptom during this follow-up period, after day 3.
  - And note the date when the symptom has disappeared or tick the box "still ongoing".
- If No, then leave empty the columns "Worst intensity/ greatest size/ highest temperature" and "End Date".

➢ *<u>BOX "STILL ONGOING" IN COLUMN "END DATE" – WHEN TO TICK IT?</u>*

- Tick the box "Still ongoing" if the illness /sign /symptom is still present at the time you return the diary card to the site

	Day 0	Day 1	Day 2	Day 3	After Day 3			Did you receive any medical attention ?	Type of medical attention To be completed by the investigator or delegate
					Ongoing	Worst Intensity/ Greatest size	End Date Tick box if still ongoing ↓

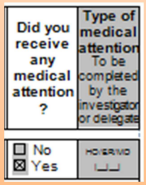
➢ *DID YOUR CHILD RECEIVE ANY MEDICAL ATTENTION? HOW TO COMPLETE THIS QUESTION?*

- Medical attention means hospitalisation, an emergency room visit or a visit to or from medical personnel.
- Tick the box "No" if your child did not visit medical personnel or was not visited by medical personnel or did not go to the hospital or an emergency room for the symptom.
- Tick the box "Yes" if your child went to the hospital, an emergency room, if your child visited medical personnel or was visited by medical personnel for the symptom.

  Keep the type of medical attention (grey column) empty. It will be completed by the study doctor or study staff.



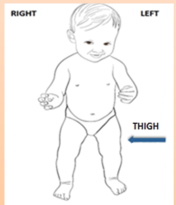
Instructions to complete:
Local symptoms

- If your child receive(s) more than one vaccine, you will have to fill in one section for each administered vaccine.

- Redness, swelling and pain may appear around the area where your child received the vaccine (administration site(s)). These are called LOCAL symptoms.
- If similar symptoms appear on another part of your child's body than this/those corresponding to the administration site(s), please report them in the Adverse Event section.

  [The study doctor or study staff should show in the drawing where is/are the administration site(s).]

For Infanrix



For Hiberix

- Write down the size of the redness and swelling in millimetres (mm) only. Use the ruler given to you by the site staff.

  Please note that in case a swelling greater than 50 mm is observed please describe the swelling on the page titled the Large Swelling Reaction

➢ *HOW TO COMPLETE THE DAILY VALUE?*

- Write down a value for each symptom and each day (measure or intensity). **Don't leave any field empty.**
- If there is no symptom, please write "0".

Injection site **Swelling** → size (mm)	mm 2	mm 0	mm 0	mm 0	☒ No ☐ Yes →	mm		☐	☒ No ☐ Yes	HOERMD __
Measure and record the greatest surface diameter (in mm).										

Daily measurement of circumference: Every day, using the tape provided to you, please measure around the vaccinated arm or leg.

INTENSITY DEFINITIONS

- Redness and swelling:

  Measure and record the greatest surface diameter in millimetres (mm).
- Pain:

  0: Absent

  1: Minor reaction to touch

  2: Cries/protests on touch

  3: Cries when limb is moved / spontaneously painful

➢ *LARGE SWELLING REACTION*

- A large swelling reaction is a swelling at the place where your child received the vaccination that has a diameter greater than 50 mm, or a large swelling that is very spread out and cannot be measured or a noticeable swelling of the vaccinated arm or thigh circumference.
- If your child has a large swelling please call the study doctor immediately.
- Please fill in the data in the large swelling reaction section. In the section below, please enter the day, month and year when the large swelling reaction was first observed.

➢ *DESCRIBE THE TYPE OF SWELLING*.

- If the swelling occurred only around the place where the vaccination shot was given and did not spread to the adjacent joint, check the first box. Adjacent joint means the shoulder or elbow (in cases where the vaccination was given in the arm) or the knee or hip joint(in cases where the vaccination was given in the thigh)
- If the swelling was spread out over a large area, but did not spread to adjacent joint, check the middle box.
- If the swelling spread to the adjacent joint

DTPA-HBV-IPV-135 117119	**DIARY CARDS** **Vaccine Dose Number 4**	**Subject Number** |__|__|__|__|__|__| To be completed by the investigator or delegate

INDURATION

- If the large swelling is hard to the touch, measure and record daily the greatest surface diameter in millimetres (mm) of the hard area.

  If the swelling is not hard, check the "No" box.

PRURITIS MEANS ITCHING

- If you notice your child has itching at the large injection site (e.g. your child is scratching or vigorously rubbing the swelling), please check "Yes" and the type of Grade it is. If there is no itch check the "No" box

FUNCTIONAL IMPAIRMENT

- If the large swelling changes the way your child moves or uses the swollen arm or leg as they normally would, please check "Yes" and the type of Grade it is. If there is no change to your child's use of the swollen arm or leg, check the "No" box.

➢ *GENERAL SYMPTOMS: TEMPERATURE*

- Please use the provided thermometer.
- Take your child's temperature each day from day of vaccination (day 0) until day 3, and write down the values.
- If you took more than once a day your child's temperature, then write down the highest one.
- The preferred route for recording temperature in this study will be Axillary for Booster vaccination.

Example: if on Day 0
- At 8 am: 98.8°F
- At 1 pm: 99.3°F
- At 7 pm: 99.7°F

→ 99.7°F is to be recorded in for Day 0

- Please write down NT (Not Taken) if you did not take the temperature.

General Instructions

Thank you for your child's participation in this clinical trial.

During your child's last study visit, you received a "Diary Card" to fill in every day for a defined period, so that your child's study doctor or the study staff will know your child's general health status after the vaccination.

Here below you will find general instructions on how to complete the "Diary Card". There are also other specific instructions relative to each part of the "Diary Card" that you will need to fill in.

INSTRUCTIONS TO COMPLETE THE "DIARY CARD"

- Write in clearly, use a pen (never pencil).
- The grey areas are dedicated to the investigator or delegate only. Do not write in these areas.

Illness/Sign/Symptom ☑ if at vaccine injection site ↓	Worst Intensity 1/2/3	Start Date	End Date Tick box if still ongoing ↓	Did you receive medical attention? ➢ *HOW TO CORRECT MISTAKES?*

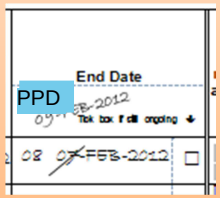
- Cross out the mistake with a single line.
- Don't hide the mistake. Don't use correction fluid or don't make inkblots.
- Write the correct response close to the mistaken one.
- If the correct response is written outside of the box, circle it and point to it with an arrow towards the box.
- **Put your initials near the correction.**
- **Date the correction**



➢ *WHO TO CONTACT IN CASE OF QUESTIONS?*

If you have any questions, please contact your child's study doctor or the study staff on the following phone number:

[insert phone n° of the study doctor or study staff]

Please contact your child's study doctor or the study staff immediately if your child has any symptoms you think are serious.

Instructions to complete:
Local and general symptoms

- If your child experience(s) any other symptoms than those listed in the local symptoms or general symptoms pages, please write these symptoms down in the Adverse Event section.
- If a symptom <u>appears only after</u> day 3, please write this symptom down in the Adverse Event section.

➢ *<u>HOW TO COMPLETE DIARY CARD FOR ANY SYMPTOM "AFTER DAY 3"?</u>*

- In the columns "After day 3", if the symptom is still ongoing* after day 3, tick "Yes". Otherwise, tick "No".

* The symptom is ongoing if after day 3:
- The intensity of the symptom is 1 or higher
- The oral (in the mouth), axillary (under the armpit), tympanic (in the ear) or rectal (in the anus) temperature is higher or equal to 100.4°F.

- If Yes,
  - Please write the worst intensity for pain, the highest temperature or the greatest measurement of Redness or swelling recorded for the respective symptom during this follow-up period, after day 3.
  - And note the date when the symptom has disappeared or tick the box "still ongoing".
- If No, then leave empty the columns "Worst intensity/ greatest size/ highest temperature" and "End Date".

➢ *<u>BOX "STILL ONGOING" IN COLUMN "END DATE" – WHEN TO TICK IT?</u>*

- Tick the box "Still ongoing" if the illness /sign /symptom is still present at the time you return the diary card to the site

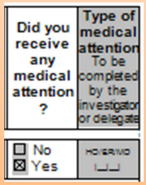
➢ *DID YOUR CHILD RECEIVE ANY MEDICAL ATTENTION? HOW TO COMPLETE THIS QUESTION?*

- Medical attention means hospitalisation, an emergency room visit or a visit to or from medical personnel.
- Tick the box "No" if your child did not visit medical personnel or was not visited by medical personnel or did not go to the hospital or an emergency room for the symptom.
- Tick the box "Yes" if your child went to the hospital, an emergency room, if your child visited medical personnel or was visited by medical personnel for the symptom.

  Keep the type of medical attention (grey column) empty. It will be completed by the study doctor or study staff.



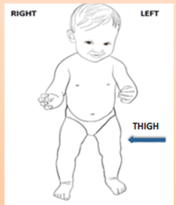
Instructions to complete:
Local symptoms

- If your child receive(s) more than one vaccine, you will have to fill in one section for each administered vaccine.

- Redness, swelling and pain may appear around the area where your child received the vaccine (administration site(s)). These are called LOCAL symptoms.
- If similar symptoms appear on another part of your child's body than this/those corresponding to the administration site(s), please report them in the Adverse Event section.

  [The study doctor or study staff should show in the drawing where is/are the administration site(s).]

For Infanrix



For ActHib

- Write down the size of the redness and swelling in millimetres (mm) only. Use the ruler given to you by the site staff.

  Please note that in case a swelling greater than 50 mm is observed please describe the swelling on the page titled the Large Swelling Reaction

➢ *HOW TO COMPLETE THE DAILY VALUE?*

- Write down a value for each symptom and each day (measure or intensity). **Don't leave any field empty.**
- If there is no symptom, please write "0".

Injection site **Swelling** → size (mm)	mm 2	mm 0	mm 0	mm 0	☒ No ☐ Yes →	mm		☐	☒ No ☐ Yes	HOERMD ⌊_⌋⌊_⌋
Measure and record the greatest surface diameter (in mm).										

Daily measurement of circumference: Every day, using the tape provided to you, please measure around the vaccinated arm or leg.

INTENSITY DEFINITIONS

- Redness and swelling:

  Measure and record the greatest surface diameter in millimetres (mm).
- Pain:

  0: Absent

  1: Minor reaction to touch

  2: Cries/protests on touch

  3: Cries when limb is moved / spontaneously painful

➢ *LARGE SWELLING REACTION*

- A large swelling reaction is a swelling at the place where your child received the vaccination that has a diameter greater than 50 mm, or a large swelling that is very spread out and cannot be measured or a noticeable swelling of the vaccinated arm or thigh circumference.
- If your child has a large swelling please call the study doctor immediately.
- Please fill in the data in the large swelling reaction section. In the section below, please enter the day, month and year when the large swelling reaction was first observed.

➢ *DESCRIBE THE TYPE OF SWELLING*.

- If the swelling occurred only around the place where the vaccination shot was given and did not spread to the adjacent joint, check the first box. Adjacent joint means the shoulder or elbow (in cases where the vaccination was given in the arm) or the knee or hip joint (in cases where the vaccination was given in the thigh)
- If the swelling was spread out over a large area, but did not spread to adjacent joint, check the middle box.
- If the swelling spread to the adjacent joint

DTPA-HBV-IPV-135 117119	**DIARY CARDS** **Vaccine Dose Number 4**	**Subject Number** |__|__|__|__|__|__| To be completed by the investigator or delegate

INDURATION

- If the large swelling is hard to the touch, measure and record daily the greatest surface diameter in millimetres (mm) of the hard area.

  If the swelling is not hard, check the "No" box.

PRURITIS MEANS ITCHING

- If you notice your child has itching at the large injection site (e.g. your child is scratching or vigorously rubbing the swelling), please check "Yes" and the type of Grade it is. If there is no itch check the "No" box

FUNCTIONAL IMPAIRMENT

- If the large swelling changes the way your child moves or uses the swollen arm or leg as they normally would, please check "Yes" and the type of Grade it is. If there is no change to your child's use of the swollen arm or leg, check the "No" box.

Instructions to complete:

General symptoms

➢ *HOW TO COMPLETE THE DAILY VALUE?*

- Write down a value for each symptom and each day (measure or intensity). **Don't leave any field empty.**
- Write "0" if there is no increase in intensity compared to normal

	Day 0	Day 1	Day 2	Day 3	After Day 3: Ongoing	Worst Intensity	End Date	Did you receive medical attention?*	Type of medical attention (To be completed by the investigator or delegate)	Relationship to inv. Product (To be completed by the investigator or delegate)
Drowsiness → Intensity (0/1/2/3)	0/1/2/3	0/1/2/3	0/1/2/3	0/1/2/3	☐ No ☐ Yes →	1/2/3	Tick box if still ongoing ↓ ☐	☐ No ☐ Yes	HOSPMD ☐	☐ No ☐ Yes

➢ *GENERAL SYMPTOMS: TEMPERATURE*

- Please use the provided thermometer.
- Take your child's temperature each day from day of vaccination (day 0) until day 3, and write down the values.
- If you took more than once a day your child's temperature, then write down the highest one.
- The preferred route for recording temperature in this study will be Axillary for Booster vaccination.

Example: if on Day 0
- At 8 am: 98.8°F
- At 1 pm: 99.3°F
- At 7 pm: 99.7°F

→ 99.7°F is to be recorded in for Day 0

- Please write down NT (Not Taken) if you did not take the temperature.

General Instructions

Thank you for your child's participation in this clinical trial.

During your child's last study visit, you received a "Diary Card" to fill in every day for a defined period, so that your child's study doctor or the study staff will know your child's general health status after the vaccination.

Here below you will find general instructions on how to complete the "Diary Card". There are also other specific instructions relative to each part of the "Diary Card" that you will need to fill in.

INSTRUCTIONS TO COMPLETE THE "DIARY CARD"

- Write in clearly, use a pen (never pencil).
- The grey areas are dedicated to the investigator or delegate only. Do not write in these areas.

Illness/Sign/Symptom ☑ if at vaccine injection site ↓	Worst Intensity 1/2/3	Start Date	End Date Tick box if still ongoing ↓	Did you receive medical attention? Tendinitis ☐	2	04-FEB-2012	08-FEB-2012 ☐	☐ No ☒ Yes	HOER/MD ☐☐	☐ No ☐ Yes

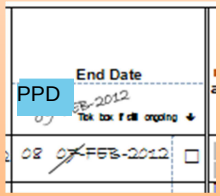
➢ *HOW TO CORRECT MISTAKES?*

- Cross out the mistake with a single line.
- Don't hide the mistake. Don't use correction fluid or don't make inkblots.
- Write the correct response close to the mistaken one.
- If the correct response is written outside of the box, circle it and point to it with an arrow towards the box.
- **Put your initials near the correction.**
- **Date the correction**



➢ *WHO TO CONTACT IN CASE OF QUESTIONS?*

If you have any questions, please contact your child's study doctor or the study staff on the following phone number:

[insert phone n° of the study doctor or study staff]

Please contact your child's study doctor or the study staff immediately if your child has any symptoms you think are serious.

Instructions to complete:
Local and general symptoms

- If your child experience(s) any other symptoms than those listed in the local symptoms or general symptoms pages, please write these symptoms down in the Adverse Event section.
- If a symptom <u>appears only after</u> day 3, please write this symptom down in the Adverse Event section.

➢ *<u>HOW TO COMPLETE DIARY CARD FOR ANY SYMPTOM "AFTER DAY 3"?</u>*

- In the columns "After day 3", if the symptom is still ongoing* after day 3, tick "Yes". Otherwise, tick "No".

* The symptom is ongoing if after day 3:
- The intensity of the symptom is 1 or higher
- The oral (in the mouth), axillary (under the armpit), tympanic (in the ear) or rectal (in the anus) temperature is higher or equal to 100.4°F.

- If Yes,
  - Please write the worst intensity for pain, the highest temperature or the greatest measurement of Redness or swelling recorded for the respective symptom during this follow-up period, after day 3.
  - And note the date when the symptom has disappeared or tick the box "still ongoing".
- If No, then leave empty the columns "Worst intensity/ greatest size/ highest temperature" and "End Date".

➢ *<u>BOX "STILL ONGOING" IN COLUMN "END DATE" – WHEN TO TICK IT?</u>*

- Tick the box "Still ongoing" if the illness /sign /symptom is still present at the time you return the diary card to the site

	Day 0	Day 1	Day 2	Day 3	After Day 3			Did you receive any medical attention ?	Type of medical attention To be completed by the investigator or delegate

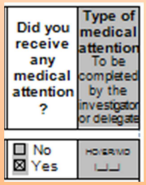
Injection site **Redness** → size (mm)	mm 10	mm 8	mm 5	mm 3	☐ No ☒ Yes →	mm 2	☒	☐ No ☒ Yes	HO/ERMD ___

➢ *DID YOUR CHILD RECEIVE ANY MEDICAL ATTENTION? HOW TO COMPLETE THIS QUESTION?*

- Medical attention means hospitalisation, an emergency room visit or a visit to or from medical personnel.
- Tick the box "No" if your child did not visit medical personnel or was not visited by medical personnel or did not go to the hospital or an emergency room for the symptom.
- Tick the box "Yes" if your child went to the hospital, an emergency room, if your child visited medical personnel or was visited by medical personnel for the symptom.

  Keep the type of medical attention (grey column) empty. It will be completed by the study doctor or study staff.



Instructions to complete:
Local symptoms

- If your child receive(s) more than one vaccine, you will have to fill in one section for each administered vaccine.

- Redness, swelling and pain may appear around the area where your child received the vaccine (administration site(s)). These are called LOCAL symptoms.
- If similar symptoms appear on another part of your child's body than this/those corresponding to the administration site(s), please report them in the Adverse Event section.

  [The study doctor or study staff should show in the drawing where is/are the administration site(s).]

For Pentacel

- Write down the size of the redness and swelling in millimetres (mm) only. Use the ruler given to you by the site staff.

  Please note that in case a swelling greater than 50 mm is observed please describe the swelling on the page titled the Large Swelling Reaction

➢ *HOW TO COMPLETE THE DAILY VALUE?*

- Write down a value for each symptom and each day (measure or intensity). **Don't leave any field empty.**
- If there is no symptom, please write "0".

Injection site **Swelling** → size (mm)	mm 2	mm 0	mm 0	mm 0	☒ No ☐ Yes →	mm		☐	☒ No ☐ Yes	HOERMD __
Measure and record the greatest surface diameter (in mm).										

Daily measurement of circumference: Every day, using the tape provided to you, please measure around the vaccinated arm or leg.

INTENSITY DEFINITIONS

- Redness and swelling:

  Measure and record the greatest surface diameter in millimetres (mm).
- Pain:

  0: Absent

  1: Minor reaction to touch

  2: Cries/protests on touch

  3: Cries when limb is moved / spontaneously painful

➢ *LARGE SWELLING REACTION*

- A large swelling reaction is a swelling at the place where your child received the vaccination that has a diameter greater than 50 mm, or a large swelling that is very spread out and cannot be measured or a noticeable swelling of the vaccinated arm or thigh circumference.
- If your child has a large swelling please call the study doctor immediately.
- Please fill in the data in the large swelling reaction section. In the section below, please enter the day, month and year when the large swelling reaction was first observed.

➢ *DESCRIBE THE TYPE OF SWELLING*.

- If the swelling occurred only around the place where the vaccination shot was given and did not spread to the adjacent joint, check the first box. Adjacent joint means the shoulder or elbow (in cases where the vaccination was given in the arm) or the knee or hip joint (in cases where the vaccination was given in the thigh)
- If the swelling was spread out over a large area, but did not spread to adjacent joint, check the middle box.
- If the swelling spread to the adjacent joint

DTPA-HBV-IPV-135 117119	**DIARY CARDS** **Vaccine Dose Number 4**	**Subject Number** |__|__|__|__|__|__| To be completed by the investigator or delegate

INDURATION

- If the large swelling is hard to the touch, measure and record daily the greatest surface diameter in millimetres (mm) of the hard area.

  If the swelling is not hard, check the "No" box.

PRURITIS MEANS ITCHING

- If you notice your child has itching at the large injection site (e.g. your child is scratching or vigorously rubbing the swelling), please check "Yes" and the type of Grade it is. If there is no itch check the "No" box

FUNCTIONAL IMPAIRMENT

- If the large swelling changes the way your child moves or uses the swollen arm or leg as they normally would, please check "Yes" and the type of Grade it is. If there is no change to your child's use of the swollen arm or leg, check the "No" box.

Instructions to complete:

General symptoms

➢ *HOW TO COMPLETE THE DAILY VALUE?*

- Write down a value for each symptom and each day (measure or intensity). **Don't leave any field empty.**
- Write "0" if there is no increase in intensity compared to normal

	Day 0	Day 1	Day 2	Day 3	After Day 3: Ongoing	After Day 3: Worst Intensity	After Day 3: End Date	Did you receive medical attention?*	Type of medical attention (To be completed by the investigator or delegate)	Relationship to inv. Product (To be completed by the investigator or delegate)
Drowsiness → Intensity (0/1/2/3)	0 1 2 3	0 1 2 3	0 1 2 3	0 1 2 3	☐ No ☐ Yes →	1 2 3	Tick box if still ongoing ↓ ☐	☐ No ☐ Yes	HOSPMED ☐☐	☐ No ☐ Yes

➢ *GENERAL SYMPTOMS: TEMPERATURE*

- Please use the provided thermometer.
- Take your child's temperature each day from day of vaccination (day 0) until day 3, and write down the values.
- If you took more than once a day your child's temperature, then write down the highest one.
- The preferred route for recording temperature in this study will be Axillary for Booster vaccination.

Example: if on Day 0
- At 8 am: 98.8°F
- At 1 pm: 99.3°F
- At 7 pm: 99.7°F

→ 99.7°F is to be recorded in for Day 0

- Please write down NT (Not Taken) if you did not take the temperature.

	Day 0	Day 1	Day 2	Day 3	After Day 3: Ongoing ≥100.4°F by any route	After Day 3: Highest Temperature	After Day 3: End Date	Did your child receive any medical attention? Instructions to complete:

Adverse Events

- If your child experience(s) any other symptoms than those listed in the local symptoms or general symptoms pages, please write these symptoms down in this section.
- If a symptom appears only after day 3, please write this symptom down in this section.
- If redness, swelling or pain appears on another area than area where your child received the vaccine, please report these symptoms in this section.

INTENSITY DEFINITIONS

- **1**: **Mild.** An adverse event which is easily tolerated by the subject, causing minimal discomfort and not interfering with everyday activities.
- **2**: **Moderate.** An adverse event which is sufficiently discomforting to interfere with normal everyday activities.
- **3: Severe.** An adverse event which prevents normal, everyday activities. (In a young child, such an adverse event would, for example, prevent attendance at school/kindergarten/a day-care centre and would cause the parents/guardians to seek medical advice).

BOX "STILL ONGOING" IN THE COLUMN "END DATE" – WHEN TO TICK IT?

- Tick the box "Still ongoing" if the illness / sign / symptom is still present at the time you return the diary card to the site.

DID YOUR CHILD RECEIVE ANY MEDICAL ATTENTION? HOW TO COMPLETE THIS QUESTION?

- Medical attention means hospitalisation, an emergency room visit or a visit to or from medical personnel (medical doctor).
- Tick the box “No” if your child did not visit a doctor or go to the hospital or an emergency room for the symptom.
- Tick the box “Yes” if your child went to the hospital, an emergency room or if your child visited a doctor for the symptom. Keep the type of medical attention (grey column) empty. It will be completed by the study doctor or study staff.

Instructions to complete:
Medication

➢ *DOSE, UNIT AND FREQUENCY*

- Write the amount of the medication your child took.

Dose, unit and frequency
200mg pill 3 times a day
2 coffee spoon 100mg once per day
3 suppositories per day
Nasal drops 4 times per day

- Most of this information can be found on the label of the medication. You may want to bring the medication to your child's next visit with the study doctor or study staff. Then they can help you to fill in the required information.

➢ *BOX "STILL ONGOING" IN THE COLUMN "END DATE" – WHEN TO TICK IT?*

- Tick the box "Still ongoing" if the medication is still taken at the time you return the diary card to the site.

Representative written information for patient and sample consent forms

Instructions for Local ICF development

The LOC should ensure that all local legal regulatory requirements are satisfied before finalizing the Local ICF. It is strongly recommended to align the content of the Local ICF with the content of the Model ICF and this template.

When developing a Local ICF, all changes to the content that affect the meaning of the Model ICF should be justified and documented locally. Any **black bold** text in the final Model ICF is GSK Vaccines' **mandatory** wording and should be retained, any alterations or additions to this text must be communicated to the central team prior to the finalization of the local ICF.

Refer to Appendix A Best Practices document for the development of the Local ICF.

Significant changes in the local ICF compared to the model ICF related to the processing and use of human biological samples and data need to be tracked in the Informed Consent Significant Changes Tracking Form. For example changes in the sample use and/or future research; sample retention period; what happens to samples or data if a subject withdraws consent; any restriction in sharing samples or data with other researchers; any changes to what data can be collected. These changes are tracked to ensure that GSK and other third parties collecting and using samples and data from GSK clinical trials are informed of and can comply with what was agreed to by the subject in the informed consent he/she signed.

Note: In the final Local ICF all text should be in the same format i.e. any bold text must be in normal font and red hidden text must not be retained.

Refer to SOP_54823, GUI_51905 and GUI-BIO-CLIN-0014 for more information.
(Delete the instructions above from the Final Local ICF).

INFORMED CONSENT FORM

Study Identification: 117119 (DTPA-HBV-IPV-135)

Study Title: Immunogenicity and safety study of GSK Biologicals' Infanrix hexa™ at 2, 4 and 6 months of age in healthy infants.

Model ICF Version Number: Final Version 03 **(replace with Version of Local ICF)**

Date: 08/APR/2014 **(replace with Date of Local ICF)**

Company Name: GlaxoSmithKline (GSK) Biologicals S.A.

Subject Identification: _____

Insert subject ID here

What is consent?

Consent means that you allow your child/ward to take part in this research study. You can decide if you want your child/ward to take part in this study or not. Please take time to read the following information and ask us if you have any questions. You can talk in confidence with your family and family doctor to help you make a decision. You must sign the consent pages at the end of this form if you decide to let your child/ward join this research study. You will receive a copy of this form.

Why is this study being done?

This research study is looking at the safety and effectiveness of *Infanrix hexa* in infants in the United States of America (USA). *Infanrix hexa* is a combination vaccine (a vaccine against more than one disease combined into one shot) that protects children against the following six diseases in a single injection: diphtheria, tetanus, pertussis, poliomyelitis, *Haemophilus influenzae* type b (Hib) and hepatitis B. Some of the effects of these diseases are explained below:

- Diphtheria is an infection of the throat. Children with diphtheria may stop breathing, have permanent damage to the heart and brain, or even die.
- Tetanus is an infection of the blood. It causes strong cramps that prevent breathing and can lead to death.
- Pertussis (whooping cough) is a highly infectious disease which causes severe coughing during which children are unable to breathe. The disease can lead to death. Recently there have been outbreaks of pertussis in several states in the US.
- Poliomyelitis is a severe disease that is highly contagious amongst children and can cause paralysis (loss or inability to move a body part) and death.
- Hib causes bacterial meningitis (an infection of the fluid and cover surrounding the brain) and infections of the blood, lungs, joints or bones. Most cases occur in children less than five years old. About a quarter of the children who survive Hib

meningitis suffer permanent damage to the brain and/or nerves ranging from mild hearing loss to mental retardation.

- Hepatitis B is a viral infection that attacks the liver and can causes life threatening liver infection. It is also a major cause of liver cancer worldwide.

In the USA, vaccination against all of these diseases is routinely recommended.

Combination vaccines are easier and more cost-effective to administer as they reduce the number of injections needed to vaccinate a child. *Infanrix hexa* is licensed in more than 98 countries around the world, including the European Union, but not in the USA. This vaccine is an investigational vaccine in the USA, which means it is still being tested and it is not approved by the government for sale.

Vaccines work by causing the body to make substances in the blood called antibodies that protect against disease. The present study will compare how *Infanrix hexa* causes the body to produce antibodies as compared to vaccines that are already approved by the government in the USA.

How is GSK involved?

GlaxoSmithKline (GSK) is a company that studies and makes vaccines, medicines and other health products. GSK planned and organized this study. GSK pays the study doctor and the institution to run this study.

GSK will be the owner of the study results. GSK plans to use the information from this study to get patents, sell the vaccine in the future or make profits in other ways. You will not be paid for any part of this.

The information and materials we give you about this study are confidential and belong to GSK. We ask that you keep it private. You can share this information with your doctor, family or friends when discussing about your child's/ward's participation in this study and your child's/ward's healthcare.

Who can join this study?

Your child/ ward can only be in this study if:

– He/she is between, and including, 6 and 12 weeks of age at the time of the first vaccination,

– He/she is healthy,

– He/she has not had a history of diphtheria, tetanus, pertussis, pneumococcal, rotavirus, poliovirus, hepatitis B and Hib disease.

– He/she has not had previous vaccinations against diphtheria, tetanus, pertussis, poliomyelitis, pneumococcal, rotavirus and Hib diseases; and has received no more than one previous dose of hepatitis B vaccine,

– You, as the parent(s)/legally acceptable representative [LAR(s)] of the child/ward provide written informed consent for your child/ward to participate in this study.

The study doctor will also check details about your child's/ward's medical history before your child/ ward can join this study. If the mother agrees by signing a separate informed consent, the study doctor will ask if the mother received vaccination against pertussis during her pregnancy. However, even if the mother does not sign the separate informed consent, the child can still be allowed to enroll and to participate in this study if he/she is eligible.

You can ask your study doctor for more details.

What does this study involve?

About 585 children will take part in this study. When we have enough children taking part in this study, we will not allow any more to join.

The study will be done in multiple locations in the USA.

Your doctor will evaluate whether your child/ward can take part in this study by asking you questions about your child's/ward's health and doing a physical examination.

The children participating in this study will be divided into three vaccination groups (the Hexa group, the Pedia group and the Penta group). Upon your consent to have your child/ward participate in the study, a computer will be used to place the children into groups. Your child/ward has a one in three chance of being placed in any one group. Neither you nor the study doctor can choose a group. You will know what vaccines your child/ward will be receiving.

All children in the study will receive vaccines at four visits. Children who are not assigned to receive the *Infanrix Hexa* vaccine will instead receive two other vaccination regimens that are standard of care in the USA. All the children will be vaccinated against the same diseases in this study.

At the first three visits (at approximately 2, 4 and 6 months of age), the following vaccines will be given by injection into the thigh muscle:

- **Hexa Group:** Children in this group will receive a single dose of *Infanrix hexa* at each of the first three visits.
- **Pedia Group:** Children in this group will receive a single dose of *Pediarix* and a single dose of *ActHib* at each of the first three visits.
- **Penta Group**: Children in this group will receive a single dose of *Pentacel* at each of the first three visits and a single dose of *Engerix-B* at either two or three visits, depending on whether your child/ward has been vaccinated against hepatitis B in the past.

In addition, all the children will receive a dose of *Prevnar13* at approximately 2, 4, and 6 months of age by injection into the thigh muscle and a dose of *Rotarix* vaccine at approximately 2 and 4 months of age orally as per US national recommendations.

At the fourth vaccination visit (at approximately 15 to 18 months of age), the following vaccines will be given by injection into the thigh or arm muscle:

- **Hexa Group**: Children in this group will receive a dose of *Infanrix* and *Hiberix* vaccines.
- **Pedia Group**: Children in this group will receive a dose of *Infanrix* and *ActHIB* vaccines.
- **Penta Group**: Children in this group will receive a dose of *Pentacel* vaccine.

Besides the vaccines given in this study, your child could receive the influenza, measles, mumps, rubella, varicella, hepatitis A, and a fourth dose of pneumococcal vaccine (*Prevnar 13*) as per US national recommendations. Talk to your doctor for more information about these.

If your child/ward is sick on the day of vaccination visit, the visit will be rescheduled during the period permitted by the study.

After each vaccination, you and your child/ward will have to stay at the study center for at least 30 minutes to make sure your child/ward does not have any immediate adverse reactions to any of the vaccinations before going home.

After your child/ward receives the vaccines, the study staff will give you a card (called a diary card) to write down information about how your child/ward feels on the day of each vaccination and for the following three days (for a total of four days). You will need to write down:

- if there was any pain, redness or swelling and the size of any redness and/or swelling where the vaccines were given. The doctor will instruct you how to measure the redness and swelling,
- any drowsiness, irritability, or loss of appetite that your child/ward experiences.
- your child's/ward's temperature and how you measured it.

You will also be asked to write down any changes in your child's/ward's health and any medications and vaccines your child/ward got besides those that are part of the study for a month after each vaccination visit.

Information about the effect of the vaccines on your child's/ward's body and health will be collected by taking a blood sample and asking you questions. Approximately 5 mL (for Visit 4 and 5) and 3.5 mL (for Visit 6) of blood will be taken from your child/ward at three separate visits to measure the amount of antibodies your child's/ ward's body made to the vaccines which were given. At the end of the study, the study doctor will be informed of your child's/ward's response to the vaccinations.

The study will last for a period of about 14-17 months. Your child/ward will need to visit the study site six times.

If you allow your child/ward to take part in this study then it is important that you follow all study activities as described here:

Day	What will happen at this visit
First phase of the study	
Day 0 (Visit 1) – your child/ward is 6 to 12 weeks of age	You will have the study purpose and procedures explained to you and you will be asked to sign the informed consent form. The doctor will ask you about your child's/ward's medical history. Your child/ward will undergo: – Physical examination – Measurement of body temperature – Administration of vaccines according to the group your child/ward is in. You will receive a diary card for Visit 1 and will be asked to use it to write down any symptom/illness your child/ward may get and medications or vaccines your child/ward may receive for a month after the study vaccination.
Month 2 (Visit 2) – your child/ward is about 4 months of age	You will return the completed diary card from Visit 1 and the study doctor will review it with you. Your child/ward will undergo: – Measurement of body temperature – Administration of vaccines according to the group your child/ward is in You will receive a diary card for Visit 2 and will be asked to write down any symptom/illness your child/ward may get and medications or vaccines your child/ward may receive for a month after the study vaccination.
Month 4 (Visit 3) – your child/ward is about 6 months of age	You will return the completed diary card from Visit 2 and the study doctor will review it with you. Your child/ward will undergo: – Measurement of body temperature – Administration of vaccines according to the group your child/ward is in You will receive a diary card for Visit 3 and will be asked to write down any symptom/illness your child/ward may get and medications or vaccines your child/ward may receive for a month after the study vaccination.
Month 5 (Visit 4) – your child/ward is about 7 months of age	You will return the completed diary card for Visit 3 and the study doctor will review it with you. Your child/ward will undergo: – Blood sampling (approximately 1 teaspoon of blood)
Month 10 (Phone-contact)- your child/ward is about 12 months of age	You will receive a phone call by the study staff asking about your child's/ward's health and about any other vaccines or medicines given during Month 5 to Month 10 of the study period.
Important non study activity: A fourth dose of *Prevnar13* is required at 12-15 months of age as part of your child's/ward's routine health care, but only the first three doses are given as part of this study. Your primary health care provider will provide the fourth dose of *Prevnar13* vaccine at 12-15 months of age. Please make sure you schedule an appointment with your primary health care provider to receive *Prevnar 13* and any other non-study vaccines as per US national recommendation at least 30 days before and/or after your child receives a study vaccine. The study doctor will ask you about the other vaccines your child might have received as per the US	

Day	What will happen at this visit
national recommendation.	
Second phase of the study	
Month 13-16 (Visit 5) – your child/ward is about 15 to 18 months of age	Your child/ward will undergo: – Physical examination – Measurement of body temperature – Blood sampling (approximately 1 teaspoon of blood) Administration of vaccines according to the group your child is in. You will receive a diary card for Visit 5 and will be asked to use it to write down any symptom/illness your child/ward may get and medications or vaccines your child/ward may receive for a month after the study vaccination.
Month 14-17 (Visit 6) – your child/ward is about 16 to 19 months of age	You will return the completed diary card for Visit 5 and the study doctor will review it with you. Your child/ward will undergo: – Blood sampling (approximately 1 teaspoon of blood) The study will then be completed.

Throughout the study, you will be asked to contact the study doctor immediately if your child/ward has any reactions or changes to his/her health, went to emergency care for a medical condition or has to be hospitalized.

You will receive a card with study contact information. Keep this card with you at all times during the study. Show this card to the medical staff if your child/ ward needs emergency care during the study. The medical staff can then contact your study doctor if needed to ask about the vaccine or product your child/ ward received.

What will happen to samples taken in this study?

The content of this section needs to be aligned with the Use of Human Samples form. Any request to changes in this section must be discussed with the central study team and the GSK Biologicals' ICF taskforce prior to finalization of the ICF.

As part of the study, samples of your child's/ward's blood will be collected. **Your** child's/ward's blood **samples may be sent to GSK or other laboratories working with GSK including those outside the United States to**:

- measure how your child's/ward's body reacts to the study vaccines,
- **ensure the quality of the tests used for the study vaccines and/ or diseases,**
- **improve tests and develop new tests linked to the study vaccines and/or diseases. These tests will never include testing related to your child's/ward's genes or hereditary characteristics.**

Your child's/ward's samples will be given a code so that it does not directly identify to your child/ward.

Your child's/ward's samples will be kept for a maximum of 20 **years from the end of the study**. **Any sample remaining at that time will be destroyed**.

Optional tests on your samples:

If you agree, your child's/ward's sample(s) may also be used for future research. GSK will always ask permission for this research to an independent ethics committee or independent review board.

You can choose not to allow these optional tests and your child/ward will still be in the study.

What side effects or risks can you expect in this study?

If your child/ward is allergic to latex, he/she should not receive the vaccines. The study staff will ask you about this.

Most children who receive vaccines remain healthy. There are some common reactions that might be observed after vaccination with *Infanrix hexa,* which can be divided into local (at the place where shot was given) and general (not local) reactions, and are described below. These reactions are usually seen within three days following vaccination.

- Local side effects (at the place where shot was given):
  - very common (reported in more than 1 in 10 children): pain, redness, swelling smaller than 50 mm (about 2 inches);
  - common (reported in more than 1 in 100 children): swelling larger than 50 mm, hard lump where the injection was given;
  - uncommon (reported in more than 1 in 1000 children): large swelling of the vaccinated limb;
  - very rare (reported in less than 1 in 10,000 children): swelling of the whole injected limb and blister where the injection was given;
- General (not local) side effects after vaccination are:
  - very common (reported in more than 1 in 10 children): fever of 100.4°F or more, loss of appetite, tiredness, irritability, restlessness and abnormal crying.
  - common (reported in more than 1 in 100 children): nervousness, vomiting, diarrhea, itching, fever of 103.1°F or more.
  - uncommon (reported in more than 1 in 1,000 children): infection of the nose, throat or windpipe, cough and feeling sleepy.
  - rare (reported in more than 1 in 10,000 children): bronchitis and rash.
  - very rare (reported in less than 1 in 10,000 children): uncontrollable shaking of the body with or without fever, skin rash (also known as hives which is an outbreak of swollen, pale red bumps, patches on the skin that appear suddenly),

swollen glands in the neck, armpit or groin, bleeding or bruising more easily than normal, temporarily stopping breathing, in babies born very prematurely (at or before 28 weeks of gestation) longer gaps than normal between breaths may occur for 2-3 days after vaccination, swelling of the face, lips, mouth, tongue or throat which may cause difficulty in swallowing or breathing, allergic reactions including anaphylactic (extreme sensitivity) reactions. These extreme sensitivity reactions can be recognized by symptoms such as an itchy rash of the hands and feet, swelling of the eyes and face, difficulty in breathing or swallowing, a sudden drop in blood pressure and loss of consciousness.

When *Infanrix hexa* and *Prevnar* are administered on the same day, higher incidence of fever > 103.1°F (1.7%) was reported as compared *to Infanrix hexa* given alone (0.6%).

It has been noted that when *Infanrix hexa* was given with *Prevnar 13* compared to *Infanrix hexa* given alone, the following events were reported more often:

Fits (with or without fever), collapse (sudden onset of muscle floppiness), periods of unconsciousness or lack of awareness and paleness or bluish skin discoloration were observed. However, all events were still rare.

Hepatitis B vaccine is included in the *Infanrix hexa*, *Pediarix*, and *Engerix-B* vaccines. During the routine use of hepatitis B vaccines, very rare events (reported in less than 1 in 10,000 children) were reported which included loss of skin sensitivity to pain or touch, swelling or infection of the brain (meningitis), numbness or weakness of the arms and legs, inflammation of nerves, blood vessels or joints; low blood pressure (hypotension) paralysis, convulsions, fits or seizures and severe allergic reactions like itchy rash of the hands and feet, swelling of eyes and feet and difficulty in breathing or swallowing.

After your child receives *Infanrix hexa*, contact the study doctor right away if your child has any of the following serious side effects:

- collapse,
- times when they lose consciousness or have a lack of awareness,
- fits – this may be when they have a fever.

These side effects have happened very rarely with other vaccines against whooping cough. They usually happen within 2 to 3 days after vaccination.

After your child/ward has received *Rotarix*, contact the study doctor right away if your child/ward has the following:

- **severe stomach pain,**
- **keeps on vomiting,**
- **has blood in his or her stools,**
- **has a swollen belly, or**
- **high fever.**

These signs may show that your child/ward has a blockage or twisting of part of his or her intestine.

GSK found in one study that this blockage or twisting happened more often, although still very rarely, in the first week after the first dose.

Pieces from a virus that is commonly seen in animals (called "PCV-1") were found in *Rotarix* vaccine. This virus does not make animals or people sick.

Please refer to the vaccines information sheet for the side effects/risks expected due to administration of the other vaccines used in this study- *Prevnar13, Pediarix, ActHIB, Pentacel, Engerix-B, Infanrix and Hiberix* vaccines. The study doctor can provide you with more information.

When a blood sample is taken from your child/ward there is the possibility that some temporary bruising and infection may occur at the site where the blood was drawn.

The vaccines in this study may not protect all children who get them. In some cases, tests may show that your child's/ward's response to the vaccination was not strong enough to protect against the diseases. If the study doctor believes your child/ward would benefit from another vaccination, he or she will contact you.

What benefits can you expect in this study?

This study may be beneficial/ useful in the following ways:

- The potential to protect your child/ward against the following major diseases: diphtheria, tetanus, pertussis, hepatitis B, poliomyelitis, Hib, pneumococcal and rotavirus diseases. However, there is no guarantee your child/ward will be protected against these diseases.
- Your child/ward will be closely watched and followed-up by the physician and his staff. Also, tests will be done on the blood samples taken from your child/ward to assess if your child/ward is protected. Such tests are not done during routine vaccination and are a benefit of study participation.
- Information from this study may help to learn more about the vaccine or disease. This will help to make new vaccines to protect people against diphtheria, tetanus, pertussis, hepatitis B, poliomyelitis and Hib diseases.

Are there other products or treatment?

This section should be completed locally using the most current information regarding the vaccines that are available in the country and their important potential benefits and risks. State if there are no alternate treatments.

There are other vaccines approved in the US that provide protection against the same diseases (although you may need to receive two shots instead of one at each visit). Your doctor can provide you with more information.

In addition, *Pedarix, ActHIB, Hiberix, Infanrix, Pentacel, Prevnar-13* and *Rotarix* are all approved in the US and your child/ward can get them from your doctor without having to participate in this study.

Talk with your doctor about your child's/ ward's options, before you decide if your child/ward should take part in this study. The study doctor can advise you if you need more information.

Does your child/ward have to stay in the study?

You may choose to withdraw your child/ward from the study at any time, without giving a reason. If you do give a reason, then it may be recorded. Your choice will not change the medical care or other benefits the child/ward will receive outside of this study.

We will share with you as soon as possible any new information that may change your choice to let your child/ward stay in the study.

Tell the study doctor if you no longer want your child/ward to take part in this study.

GSK may choose to stop the study or the study doctor may choose to stop your child's/ward's participation in the study at any time. We will then tell you why. We may ask you to withdraw your child/ward from the study if:

- Test results show that this study is not right for your child/ward
- You do not follow study instructions
- The study doctor thinks it is in your child/ward's best interest to stop, e.g. if your child/ward develops specific health problems.

What happens if your child/ward leaves the study?

Check local regulations and seek local legal advice for the use of data after subject withdrawal. If any changes are made to this section in the Local ICF compared to the Model ICF, in response to a request from any source, these should be discussed with the central study team and GSK Vaccines' ICF taskforce for alignment prior to the finalization of the local ICF, so that the impact for database collection can be taken into account. Significant changes to this section must be documented in the Tracking Form.

You may choose to stop your child/ward from being in this study at any time, without giving a reason. **We will keep and use the data and samples collected before your child/ward left the study. The study doctor may find out information about your child's/ward's health after your child/ward has left the study. The study doctor will send this information to GSK if it involves the safety profile of the vaccine.**

What about your personal and medical information?

If changes are made to this text it needs to be checked with the local Legal team that this is aligned with local rules and regulations. These changes must be discussed with the central study team and GSK Vaccines' ICF taskforce for alignment prior to the finalization of the local ICF, so that the impact for data sharing can be taken into account. Significant changes to this section must be documented in the Tracking Form.

It is very important that your child's/ward's personal and medical information stay confidential and secure. Your child's/ward's personal and medical information will be protected in accordance with current law.

When you sign this consent form you agree that your child/ward's personal and medical information can be used as described here.

- Your child's/ward's personal and medical information may be checked by GSK and others [like agencies that approve and monitor studies, for example the Food and Drug administration (FDA)]. This is to make sure that the study is being run properly.
- Besides that, only the researchers at this study site can use information that identifies your child/ward (such as name and address) and only for the purpose of the study.
- Your child's/ward's information collected during the study will be labelled with a code number (for example, PPD It will not include your child/ward's name or address. The study doctor will have the link between your child/ward's name and the code number.
- The link between your child's/ward's name and the code number will not be shared. Only the code number and coded information will be sent to GSK.
- GSK will use your child's/ward's coded information for research only, including research looking at improving the quality and efficiency in conducting clinical research trials in general.
- GSK may do the following with your child's/ward's coded study information:
  - keep it electronically, and analyze it by computer to find out what the study is telling us. This may be done by GSK or a third party, in which case GSK will ensure that the third party is required to keep your data secure.
  - share it with regulatory agencies that approve new vaccines and medicines,
  - share it with people who check that the study is done properly (like the independent ethics committee or review boards),
  - combine it with results from other studies to learn more about the vaccine and other vaccines and this disease and related diseases. This may help us to assess the risks and benefits of GSK (or other) vaccines or medicines, or to improve disease understanding,
  - publish study results in medical journals, for meetings and on the internet for other researchers to use. Your child's/ward's name will not appear in any publication.
  - share coded information with other companies, organizations or universities to carry out research, including research looking at improving the quality and efficiency in conducting clinical research trials in general.

Personal and medical data collected during the trial may be moved to, stored and used in the country where you live or another country where GSK or those working with GSK work.

Use of this information may take place in countries with lower data protection rules than the country where you live. GSK will make sure that if your child/ward's data are moved to another country, it will still be treated as stated in this Informed Consent Form.

A description of this clinical trial will be available on the GSK Clinical Study Register http://www.gsk-clinicalstudyregister.com/ and may also appear in clinical trial registries in countries in which the clinical study is conducted.

A description of this clinical trial will be available on http://www.clinicaltrials.gov, as required by U.S. Law. This web site will not include information that can identify your child/ward. At most, the web site will include a summary of the results. You can search this web site at any time.

If you withdraw your consent for us to use your child's/ward's personal information your child/ward will no longer be able to continue in the study.

At any time, you may ask to see your child's/ward's personal information and correct it if necessary.

In some circumstances you may not be able to access your child/ward's study information while the study is ongoing. However the study doctor will share any important medical information if it is relevant to your child/ward's health during the course of the study.

You should know that once identifiable medical information about your child/ward is given to someone that is not a health care provider, it is not protected by the US federal privacy rules called the HIPAA Privacy Regulations.

What happens if your child/ward gets hurt while taking part in this study?

GSK will help pay for your child/ward's care if your child/ward is hurt by the study vaccines or a procedure done to your child/ward as part of the study. GSK will pay for reasonable and necessary care for the injury that is not covered by the National Vaccine Injury Compensation Fund. GSK will not pay for any other expenses. To pay these medical expenses, GSK will need to know some information about your child/ward like your child/ward's name, date of birth, and social security number or Medicare Health Insurance Claim Number. This is because GSK has to check to see if your child/ward receives Medicare and if your child/ward does, report the payment it makes to Medicare. GSK will not use this information for any other purpose.

Signing this consent form does not change any legal rights your child/ward may have.

Will you be paid for your child/ward being in the study?

This section should be completed locally.

You will be paid for the cost of travelling to your child's/ward's study visits. You may receive up to **[amount]** for travel / per visit.

Do you have to pay anything to allow your child/ward to be in the study?

Authors note that this section is optional. This section should be completed locally.

Your child/ward will get all the study vaccines and study tests and procedures for free **[or indicate if there is a cost]**.

Who should you contact if you have questions?

Identify who the legally acceptable representative should contact for information about the study, the subject's rights or study-related injuries. This section may be completed at Country Level.

Person to contact for any questions: **name, address, telephone number.**

Person to contact about your rights: **name, address, telephone number.**

Person to contact in case of injury: **name, address, telephone number.**

Signature of person conducting consent _____ Date: _____ day/ month/ year

I confirm that I am independent of the study, that I attended the informed consent process and that I have read the written information for the study.

*Printed name of Witness _____

Signature of Witness _____ Date: _____ day/ month/ year

* Witness is only required if the subject/ legally acceptable representative is unable to read.

Delete the following Appendix in the Final local ICF.

Appendix A GlaxoSmithKline Vaccines Best Practices Document for the Development of the Local ICF

Introduction

The local informed consent form (ICF) is created based on the GSK Vaccines internally approved model ICF and is adapted according to country or local requirements.

The model ICF is the recommended content and structure which contains all ICH and GSK required elements and is aligned with the study protocol.

The content of the local ICF should be aligned with the Model ICF and any local specifications and regulations included.

The local GSK approved version should be submitted for ethical/regulatory approval and should be presented to the subject/patient and/or their legally acceptable representative.

It is essential that the version of the local ICF is accurately tracked, with a unique version number, date and reference to the model ICF on which it is based, to ensure that the correct version of the ICF is used and can be identified if needed.

It is strongly recommended to have a final local ICF, back-translated in English, available in the Investigator's study file to ensure site readiness in case of audits and/or inspections.

Objective

These best practices are intended to give adequate support and to ensure consistency while developing the local ICF from the model ICF.

It is a tool to know what changes are not permitted and what changes can be justified and/or are required per local regulations and site specific information.

The development of the accurate and complete local ICF is a local responsibility and alignment with the model ICF is essential to study conduct.

Any changes made to the local ICF from the model ICF must be documented at local level.

Human Sample Management

The collection of human tissue samples, the intended use, and secondary use, if retained, and how the subject's confidentiality would be maintained for the retained samples, must be reported in the ICF.

The content of this section must be fully aligned with the Use of Human Samples form. This form allows the central project team to track the actual testing at GSK (or laboratories used for GSK-sponsored studies) with the individual subject's consent and

local regulations. To avoid ethical and legal implications and invalidating the study data, any changes made to this section must be discussed with the central study team and GSK Vaccines' central ICF taskforce for alignment prior to the finalization of the local ICF.

Significant changes to this section must be documented in the Tracking Form.

Subject/patient data after withdrawal

The retention of samples collected and data recorded before withdrawal and the continued collection of safety information after withdrawal must be reported in the ICF. Check local regulations and seek local legal advice for the use of data after subject/patient withdrawal. If any changes are made to this section in response to a request from any source, these changes must be discussed with the central study team and GSK Vaccines' central ICF taskforce for alignment prior to the finalization of the local ICF, so that the impact for database collection and sample destruction can be taken into account.

Significant changes to this section must be documented in the Tracking Form.

What about your personal and medical information?

The content of this section is required by ICH-GCP and must be included in the ICF so that the subject is well informed before consenting to participation. Omitting this information would be violating the confidentiality and the data privacy of the subject/patient and could have legal implications. If any changes are made to this section in response to a request from any source, these changes must be discussed with the central study team and GSK Vaccines' central ICF taskforce for alignment prior to the finalization of the local ICF, so that the impact for data sharing can be taken into account.

Significant changes to this section must be documented in the Tracking Form.

Type of changes

Changes to the local ICF can be classified into 3 categories:

'Not permitted' changes

BOLD BLACK mandatory text in the model ICF should not be changed.

'Required' changes

Required changes must be made in the local ICF to add country-specific or center-specific information. (Indicated as **BOLD RED** text in the model ICF e.g. investigator details).

'Justified' changes

Justified changes may be necessary in some countries to comply with local requirements / regulations or to comply with a specific template e.g. country specific compensation guidance text.

In addition, some text can be clarified / simplified, provided the meaning remains the same as in the model ICF and does not contradict or change the intended meaning of the model ICF.

Changes that require a specific rationale or justification, that may be necessary in specific situations e.g. storage duration of samples, or changes required by the relevant Ethics Committees, can also be justified.

Best Practices per ICF Section

This table describes the type of changes (not permitted, required or justified) for each ICF section of the local ICF compared to the model ICF.

ICF section	Type of changes	Rationale/Impact
Study Identification		
Check if study identification is identical to Model ICF.	Not permitted	The study identification and study number allows us to link the document to the study protocol, the corresponding IRB/IEC approvals, all relevant study documentation and ensures that the subject/patient is linked to the correct study.
Study Title		
Check if study title is identical to Model ICF.	Not permitted	The study title allows us to link the document to the study protocol, the corresponding IRB/IEC approvals, all relevant study documentation and ensures that the subject/patient is linked to the correct study.

Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
ICF Version Number and Date		
Update with version and date of Local ICF and check if reference to the Model ICF version and date is included. Specify country and subset if applicable.	Required	It is mandatory to include an ICF version number, the date of the final version, the page number and the total number of pages (for the Local and Model ICF). Each ICF type has to be uniquely identified and must include a reference to the source. The version of the local ICF allows us to link the ICF to the corresponding approval documents. If the version is omitted in the local ICF, the subject may not receive the most up to date ICF and thus may not receive the complete information required to make an informed consent.
Company Name		
Check if company name is GlaxoSmithKline (GSK) Biologicals S.A. or the local GSK affiliate if this is required by local regulations.	Justified	A change to this section is permitted if it is justified by local regulations. For some countries, the local GSK affiliate should be indicated as Company Name.
Subject/Patient Identification		
Check whether there is space foreseen to insert the subject ID.	Required	The subject/patient ID should be mentioned on the ICF to be able to link the subject/patient ID with the corresponding source documents and RDE entries.
Header		
Check if study identification in header is identical to Model ICF.	Not permitted	The study identification and study number allows us to link the document to the study protocol, the corresponding IRB/IEC approvals, all relevant study documentation and ensures that the subject/patient is linked to the correct study.

Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
Footer		
Indicate version of Local ICF and check if reference to the Model ICF version is included. Specify country and subset if applicable.	Required	It is mandatory to include an ICF version number, the date of the final version, the page number and the total number of pages (for the Local and Model ICF). Each ICF type has to be uniquely identified and must include a reference to the source. The version of the local ICF allows us to link the ICF to the corresponding approval documents. If the version is omitted in the local ICF, the subject/patient may not receive the most up to date ICF and thus may not receive the complete information required to make an informed consent.
What is consent?		
Explain the consent process and check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	Freely given and written informed consent must be obtained from each subject/patient/LAR prior to study participation. Informed consent involves an education and information exchange that takes place between the researcher and the potential subject/patient. How the process of consenting looks like, needs to be explained in the ICF. The text can be simplified, if necessary.
Why is this study being done?		
Describe the study aim and check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	The content of this section is required by ICH-GCP. If any of this information is omitted in the local ICF, the subject/patient may not receive the complete information required to make an informed consent. Text can be simplified if necessary.

Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
How is GSK involved?		
Check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	The role of the sponsor should be explained in this section. The text can be simplified if necessary.
Who can join this study?		
Summarize the main inclusion and exclusion criteria. Check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	If any of this information is omitted in the local ICF, the subject/patient may not receive the complete information required to make an informed consent. Text can be simplified if necessary.
What does this study involve?		
Explain the approximate number of subjects/patients involved in the study, the study design and groups, the study procedures and check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	The content of this section is required by ICH-GCP. If any of this information is omitted in the local ICF, the subject/patient may not receive the complete information required to make an informed consent. Text can be simplified if necessary
If subject cards are used, check if the text is identical to the Model ICF.	Not permitted	Subject cards provide information about the study which can be used in the event of a medical emergency. Provision of this information in the ICF ensures that the subject/patient is aware of the use of the subject card. This information will also indicate to the ethics committee that it is provided to the subject/patient.
What about pregnancy and breastfeeding?		
Check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	If any of this information is omitted in the local ICF, the subject/patient may not receive the complete information required to make an informed consent. Text can be simplified if necessary.

Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
What will happen to samples taken in this study?		
Check if all mandatory wording from the Model ICF is present in the Local ICF.	Not permitted	If this text is changed, there is a risk to use human samples outside the subject's/patient's consent. This has major ethical implications and can lead to a loss of company reputation, lack of confidence, invalid study data etc… . Significant changes to this section must be documented in the Tracking Form
Check if the QA (Quality Assurance), test improvement and new test method development in the scope of the study protocol is reported in the Local ICF.	Not permitted	This testing will be done at <u>all times</u>, assuming it is allowed as per individual subject's/patient's consent. If this testing is not mentioned in the ICF, there is a risk that GSK will be unable to perform the protocol tests and therefore this type of testing cannot be omitted. Also refer to the Clarification Paper on the future use of biospecimens.
Check Local regulations regarding storage duration. Check if the wording "for a maximum of 20 years" is not changed into "for 20 years". [If there are concerns regarding this text then this should be discussed with the central project team and GSK Vaccines' central ICF taskforce for alignment prior to the finalization of the local ICF]	Justified	It is necessary to put a defined storage period in the ICF. As a standard, GSK proposes to store samples for "for a maximum of"20 years. Attention should be paid to the used wording "**for a maximum of**" 20 years. This wording allows GSK to cover different situations (e.g. to keep samples for maximum 20 years, to destroy samples when GSK no longer wants to store them or no longer is interested in testing, when physical integrity of some type of samples does not permit such long storage, etc). Any changes to this section should be captured in the Sample Retention Period Form. This will allow the laboratory to take the appropriate measures for sample storage, "for a maximum of 20"

ICF section	Type of changes	Rationale/Impact
		years or as defined in the ICF and documented in the section called "other". Significant changes to this section must be documented in the Tracking Form
Check local regulations regarding future research. [If there are concerns regarding this text then this should be discussed with the central study team and GSK Vaccines' central ICF taskforce for alignment prior to the finalization of the local ICF]	Justified	A change to this section is justified, since depending on local regulations, this type of testing is allowed or not. However, the wording of the text itself, should not be changed and nothing should be added! We capture this info in the CRF/eCRF, which contains standard wording so if the wording in the ICF is changed, this will not be matching. This form allows the central study team to track the actual testing at GSK (or laboratories used for GSK-sponsored studies) with the individual subject's/patient's consent and local regulations. If this text is changed, there is a risk to use human samples outside the subject's consent. This has major ethical and legal implications and can lead to a loss of company reputation, lack of confidence, invalid study data, etc…. Also refer to the Clarification Paper on the future use of biospecimens.

Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
What side effects or risks can you expect in the study?		
Check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	The content of this section is required by ICH-GCP. The reasonably foreseeable risks or inconveniences to the subject should be mentioned in the ICF. If any of this information is omitted in the local ICF, the subject may not receive the complete information required to make an informed consent. Text can be simplified if necessary. Refer to the GSK Position Paper on 'Communication of Individual Immunological Assay Results to Study Sites' for additional information.
Check if the text on autoimmune diseases (applicable if product/vaccine contains an adjuvant) is identical to the Model ICF.	Not permitted	The text on autoimmune diseases has been approved by GSK upper management following feedback from Authorities. The AID wording should remain consistent in all projects and countries. There is a reputational risk associated to the fact that GSK might seem to be sharing different information with Subjects/Patients/Externally on AID.
Check if the text on Rotarix, if applicable, is identical to the Model ICF.	Not permitted	This text has been approved by GSK upper management following feedback from Authorities.

Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
What benefits can you expect in the study?		
Check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	The content of this section is required by ICH-GCP. The reasonably expected benefits or indirect benefits or if there is no direct clinical benefit for the subjects/patients must be included in the local ICF. Text can be simplified if necessary
Are there other products or treatment?		
Check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	It is an ICH-GCP requirement to provide to the subject information on alternative procedures or treatment that may be available and their important potential benefits and risks. Omitting any of this information would be violating the rights of the subject/patient to freely participate to the study and would be putting the company reputation at risk. Text can be simplified if necessary.
Add currently available local alternatives, if applicable.	Required	This information must be added locally to the ICF using the most current information regarding the treatments that are available in the country.
Do you have to stay in the study?		
Explain voluntary participation and check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	The content of this section is required by ICH-GCP. Omitting any of this information would be violating the rights of the subject/patient to freely participate to the study and would be putting the company reputation at risk. Text can be simplified if necessary.

Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
What happens if you leave the study?		
Check if the text on the use of data after subject/patient withdrawal is identical to the Model ICF. [Check local regulations and seek local legal advice] [If the text needs to be changed it should be discussed with the central project team and GSK Vaccines' central ICF taskforce for alignment prior to the finalization of the local ICF].	Justified	The bold text in this section has been approved by Medical Governance. Changes to this section in response to a request from any source, can have an impact for database collection and sample handling and should therefore be discussed with the central teams for alignment. Also refer to the Clarification Paper on the Handling of Data after Subject Withdrawal. Significant changes to this section must be documented in the Tracking Form.
What about your personal and medical information?		
Check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary). [If the text needs to be changed, it should be reviewed by the local legal team]. [If the text needs to be changed it should be discussed with the central study team and GSK Vaccines' central ICF taskforce for alignment prior to the finalization of the local ICF].	Justified	The content of this section is required by ICH-GCP and must be included in the ICF so that the subject is well informed before consenting to participation. Omitting this information would be violating the confidentiality and the data privacy of the subject/patient and could have legal implications. Text can be simplified if necessary. Significant changes to this section must be documented in the Tracking Form.

GlaxoSmithKline Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
What happens if you get hurt while taking part in this study?		
- For UK, US and countries without special local regulations, check if compensation section is not changed compared to the section in the Model ICF. [If changes are made, the CMD (Country Medical Department) should ensure that all local legal regulatory requirements are satisfied.]	Justified	The content of this section is required by ICH-GCP. In the UK and in countries where there is no local scheme, GSK will apply the Clinical Trial Compensation guidelines set down by the UK Association of British Pharmaceutical Industry (ABPI) to compensate subjects/patients for GSK sponsored clinical study related injury
- For other countries where there is compensation for injury, the CMD (Country Medical Department) should ensure that the rules and conventions required locally are applied.	Justified	The content of this section is required by ICH-GCP and must be completed so that the subject/patient is well informed before consenting to participation.
Will you be paid for being in the study?		
Information related to this section is added at a regional or country level.	Required	The content of this section is required by ICH-GCP and must be included in the ICF so that the subject/patient is well informed before consenting to participation. The anticipated prorated payment or other financial benefit, if any, to the subject for participating in the study should be mentioned in the ICF. Explain if expenses incurred by subjects for clinical visits made because of their participation in the study will be reimbursed or not.

Best Practices Document for the Development of the Local ICF

ICF section	Type of changes	Rationale/Impact
Do you have to pay anything to be in the study?		
This section is optional. Information related to this section is added at a regional or country level when it is appropriate for a study and/or is required by local practice.	Justified	If appropriate for a study, include here information on cost/expenses that subject/patient will have to bear for taking part in the study i.e., whether the subject/patient or the subject's/patient's insurance will be charged for any study item or procedure. According to ICH-GCP, the anticipated expenses, if any, to the subject/patient for participating in the study should be mentioned.
Who should you contact if you have questions?		
Add local contact details.	Required	The content of this section is required by ICH-GCP. The subject/patient must have a contact person for further information regarding the study, his rights and who to contact in the event of trial-related injury.
Consent statement		
Check if the meaning of the text is not changed compared to the Model ICF (Text can be simplified if necessary).	Justified	The consent statement should be aligned with ICH-GCP requirements. Omitting any of the information can have legal implications
Check local regulations regarding future research (type 4 testing). Check if the wording is identical to the wording in the body of the ICF. [If there are concerns regarding this text then this should be discussed with the central project team and GSK Vaccines' central ICF taskforce for alignment prior to the finalization of the local ICF]	Justified	A change to this section is justified, since depending on local regulations, this type of testing is allowed or not. This type of testing is optional for the subject/patient, meaning that if this testing is mentioned in the body of the ICF, a tick box should be available in the consent statement. The wording of the text itself, should not be changed and nothing should be added! We capture this info in the CRF/eCRF by using the UHSF, which contains standard wording so if the wording in the ICF is

ICF section	Type of changes	Rationale/Impact
		changed, this will not be matching with the UHSF.
Check local regulations for the legal of age of consent, the use of LARs, witnesses and any documentation requirements.	Justified	An additional line can be added if two LARs or two witnesses are needed as per local law. Refer to SOP_54823 and local regulations.

ADDENDUM 1 TO THE INFORMED CONSENT FORM FOR THE SUBJECT'S MOTHER

[Country to be inserted]

Study Identification: 117119 (DTPA-HBV-IPV-135)

Study Title: Immunogenicity and safety study of GSK Biologicals' Infanrix hexa™ at 2, 4 and 6 months of age in healthy infants.

Version and Date: Addendum 1 to the Model ICF Version 03 16/APR/2014

Company Name: GlaxoSmithKline (GSK) Biologicals S.A.

Subject Identification: _____

This document should be presented to the subject's mother in full; no pages or sections should be omitted. The document contents should be explained verbally to the subject's mother.

Purpose of this document

You have already signed an informed consent form to allow your child's participation in a research study of the safety and effectiveness of GSK Biologicals' *Infanrix hexa* vaccine in infants in the United States of America (USA).

One of the diseases that the vaccines in the study will vaccinate the infants against is pertussis (whooping cough). There have been recent outbreaks of pertussis in the US, and infants too young to be fully vaccinated against pertussis are at greatest risk for severe disease and even death due to pertussis. In order to protect newborns, the Advisory Committee on Immunization Practices (the group that sets the immunization schedule for the USA) recommended in October 2012 that all women receive a vaccine against pertussis in their third trimester of pregnancy, so that antibodies (what the body makes to protect against disease) transferred from their blood into their infants blood during pregnancy would protect both mothers and their infants. The pertussis vaccine that will be given to the mother is a tetanus, diphtheria toxoid and pertussis vaccine called Tdap.

Since the recommendation to vaccinate the mothers is quite recent, not all mothers of the children in this study will have been vaccinated with Tdap during pregnancy. It is not known whether the mother's antibodies in their infant's bloodstream will affect the infants' ability to make their own antibodies to the study vaccines, so we want to study the responses of the infants enrolled in this study based on whether their mothers received the Tdap vaccine during pregnancy.

This document is intended to obtain your consent in order to collect information about any Tdap vaccination that you might have received during your pregnancy.

Addendum 1 to the Informed Consent Form

CONFIDENTIAL
117119 (DTPA-HBV-IPV-135)

What about your personal and medical information?

It is very important that your personal and medical information stay confidential and secure. Your personal and medical information will be protected in accordance with current law.

When you sign this consent form you agree that your personal and medical information can be used as described here.

- Your personal and medical information may be checked by GSK and others [like agencies that approve and monitor studies, for example the Food and Drug administration (FDA)]. This is to make sure that the study is being run properly.
- Besides that, only the researchers at this study site can use information that identifies you (such as name and address) and only for the purpose of the study.
- Your information collected during the study will be labelled with a code number (for example, PPD It will not include your name or address. The study doctor will have the link between your/your child's name and the code number. The code number assigned to you will be your child's code number.
- The link between your/your child's name and the code number will not be shared. Only the code number and coded information will be sent to GSK.
- GSK will use your/your child's coded information for research only, including research looking at improving the quality and efficiency in conducting clinical research trials in general.
- GSK may do the following with your/your child's coded study information:
  - keep it electronically, and analyze it by computer to find out what the study is telling us. This may be done by GSK or a third party, in which case GSK will ensure that the third party is required to keep your data secure.
  - share it with regulatory agencies that approve new vaccines and medicines,
  - share it with people who check that the study is done properly (like the independent ethics committee or review boards),
  - combine it with results from other studies to learn more about the vaccine and other vaccines and this disease and related diseases. This may help us to assess the risks and benefits of GSK (or other) vaccines or medicines, or to improve disease understanding,
  - publish study results in medical journals, for meetings and on the internet for other researchers to use. Your name will not appear in any publication.
  - share coded information with other companies, organizations or universities to carry out research, including research looking at improving the quality and efficiency in conducting clinical research trials in general.

Addendum 1 to the Informed Consent Form

CONFIDENTIAL

117119 (DTPA-HBV-IPV-135)

Personal and medical data collected during the trial may be moved to, stored and used in the country where you live or another country where GSK or those working with GSK work.

Use of this information may take place in countries with lower data protection rules than the country where you live. GSK will make sure that if your data are moved to another country, it will still be treated as stated in this Informed Consent Form.

A description of this clinical trial will be available on the GSK Clinical Study Register http://www.gsk-clinicalstudyregister.com/ and may also appear in clinical trial registries in countries in which the clinical study is conducted.

A description of this clinical trial will be available on http://www.clinicaltrials.gov, as required by U.S. Law. This web site will not include information that can identify you. At most, the web site will include a summary of the results. You can search this web site at any time.

At any time, you may ask to see your personal information and correct it if necessary.

In some circumstances you may not be able to access your study information while the study is ongoing. However the study doctor will share any important medical information if it is relevant to your health during the course of the study.

You should know that once identifiable medical information about you is given to someone that is not a health care provider, it is not protected by the US federal privacy rules called the HIPAA Privacy Regulations.

Your consent is voluntary. Refusal will involve no penalty or loss of benefits or attention that your child is otherwise entitled to receive from your healthcare provider. Refusal will also not hamper your child's participation in this study.

You should not sign this document unless you have received satisfactory answers to all of your questions. You will receive a signed copy of this form to take home.

Do you agree that we will collect your Tdap vaccination history during pregnancy?

☐ **Yes** ☐ **No**

ADDENDUM 2 TO THE INFORMED CONSENT FORM

[Country to be inserted]

Study Identification: 117119 (DTPA-HBV-IPV-135)

Study Title: Immunogenicity and safety study of GSK Biologicals' Infanrix hexa™ at 2, 4 and 6 months of age in healthy infants.

Version and Date: Addendum 2 to the Model ICF Version 03 28/OCT/2014

Company Name: GlaxoSmithKline (GSK) Biologicals S.A.

Subject Identification: _____

This document should be presented to the subject's parent(s)/legally acceptable representative(s) [LAR(s)] in full; no pages or sections should be omitted. The document contents should be explained verbally to the subject's parent(s)/LAR(s).

Purpose of this document

You have already signed an informed consent form to allow your child's/ward's participation in a research study of the safety and effectiveness of GSK Biologicals' *Infanrix hexa* vaccine in infants in the United States of America (USA).

By means of this document, we would like to provide you with some new information regarding the collection of information on any injection site swelling that your child/ward may experience after vaccination and new information that recently became available about GSK Biologicals' rotavirus vaccine, *Rotarix* which is one of the vaccines that is given in the study your child/ward is taking part.

Please note that your child/ward would have already received the first and second dose of the *Rotarix* vaccine in this study and intussusceptions (twisting or blockage of a part of the intestine) is more often seen during seven days after the first dose and to a lesser extent after the second dose of *Rotarix* vaccine. The updated text regarding intussusceptions provided below is for your information.

The following section of the informed consent which you signed at the start of the study has been updated and the new text is indicated in ***bold italics***.

What does this study involve?

The informed consent that you have signed mentioned the following:

After your child/ward receives the vaccines, the study staff will give you a card (called a diary card) to write down information about how your child/ward feels on the day of each vaccination and for the following three days (for a total of four days). You will need to write down:

- if there was any pain, redness or swelling and the size of any redness and/or swelling where the vaccines were given. The doctor will instruct you how to measure the redness and swelling.
- any drowsiness, irritability, or loss of appetite that your child/ward experiences.
- your child's/ward's temperature and how you measured it.

Please read carefully the following new information:

After your child/ward receives the vaccines, the study staff will give you a card (called a diary card) to write down information about how your child/ward feels on the day of each vaccination and for the following three days (for a total of four days). You will need to write down:

- if there was any pain, redness or swelling and the size of any redness and/or swelling where the vaccines were given. The doctor will instruct you how to measure the redness and swelling.
- any drowsiness, irritability, or loss of appetite that your child/ward experiences.
- your child's/ward's temperature and how you measured it.
- ***After the fourth vaccination, when your child/ward is 15-18 months of age, you will also have to measure the circumference (length around) the arm or leg where your child/ward received a vaccine. The doctor will instruct you how to measure this length.***
- ***If after the fourth vaccination, the swelling where the vaccine was given is greater than 50 mm and/or you feel the swelling is quite noticeable, you will also have to write down additional symptoms such as itching, hardness and whether the swelling interferes with the use of the injected arm or leg. You will also have to call the study doctor and come in right away for examination of the swelling.***

What side effects or risks can you expect in this study?

The informed consent that you have signed mentioned the following:

After your child/ward has received *Rotarix*, contact the study doctor right away if your child/ward has the following:

- severe stomach pain,
- keeps on vomiting,

- has blood in his or her stools,
- has a swollen belly, or
- high fever.

These signs may show that your child/ward has a blockage or twisting of part of his or her intestine.

GSK found in one study that this blockage or twisting happened more often, although still very rarely, in the first week after the first dose.

Pieces from a virus that is commonly seen in animals (called "PCV-1") were found in *Rotarix* vaccine. This virus does not make animals or people sick.

Please read carefully the following new information:

After your child/ward has received *Rotarix*, contact the study doctor right away if your child/ward has the following:

- severe stomach pain,
- keeps on vomiting,
- has blood in his or her stools,
- has a swollen belly, or
- high fever.

These signs may show that your child/ward has a blockage or twisting of part of his or her intestine.

Large post-marketing safety studies indicate a transient increased incidence of intussusception after vaccination, mostly within 7 days of the first dose and, to a lesser extent, the second dose.

The overall incidence of intussusception remains rare.

Pieces from a virus that is commonly seen in animals (called "PCV-1") were found in *Rotarix* vaccine. This virus does not make animals or people sick.

Addendum 2 to the Informed Consent Form Subject ID_____

CONFIDENTIAL
117119 (DTPA-HBV-IPV-135)

Your consent is voluntary. Refusal will involve no penalty or loss of benefits or attention that your child/ward is otherwise entitled to receive from your healthcare provider.

You should not sign this document unless you have received satisfactory answers to all of your questions. You will receive a signed copy of this form to take home.

Audit Certificates

AUDIT CERTIFICATE

Study Number: 117119

Good Clinical Practice (GCP) is an international ethical and scientific quality standard for designing, conducting, recording and reporting trials that involve the participation of human subjects. Compliance with this standard provides public assurance that the rights, safety and well being of trial subjects are protected, consistent with the principles that have their origin in the Declaration of Helsinki, and that the clinical trial data are credible.

Clinical studies are conducted by or on behalf of GlaxoSmithKline in accordance with Standard Operating Procedures, which conform to the requirements of international GCP guidelines (ICH Harmonised Tripartite Guidelines E6 for Good Clinical Practice, FDA 21CFR parts 50, 56 and 312).

During the conduct and reporting of this/these study(s), the following independent audits were performed by or on behalf of GlaxoSmithKline.

Study Number	Type	Conducted by	Centre number	Country	Audit Date
117119	Investigator Site	GSK-CQA	PPD	USA	4-6 Nov 2014
117119	Investigator Site	GSK-CQA		USA	21-23 Oct 2014
117119	Investigator Site	GSK-CQA		USA	4-6 Nov 2014
117119	Investigator Site	GSK-CQA		USA	4-5 Nov 2014
117119	Investigator Site	GSK-CQA		USA	13-14 Oct 2014
117119	Investigator Site	GSK-CQA		USA	24-26 Aug 2015

Clinical Quality Assurance hereby confirm that the audits detailed above were carried out in accordance with appropriate regulatory requirements and guidelines in order to assess compliance with the study protocol, ICH GCP, FDA 21CFR parts 314.50 and 601.2, appropriate standard operating procedures and policies.

Statistical Analysis Plan

Detailed Title:	A Phase III, randomized, open-label, controlled, multicenter study to evaluate immunogenicity and safety of GSK Biologicals' Infanrix hexa™ vaccine when administered to healthy infants as primary vaccination at 2, 4 and 6 months of age, co-administered with Prevnar® and Rotarix™ with a booster dose of GSK Biologicals' Infanrix® and Hiberix™ vaccines at 15-18 months of age
eTrack study number and Abbreviated Title	117119 (DTPA-HBV-IPV-135)
Scope:	All data pertaining to the above study.
Date of Statistical Analysis Plan	29-Nov-2017 (Amendment 2)
Co-ordinating author:	PPD (Lead statistician)
Other author:	PPD (statistician)
Adhoc reviewers for first version:	PPD (Regulatory representative) , PPD PPD (Safety representative)
Approved by:	PPD (Clinical and Epidemiology R&D Project Leader), PPD Clinical Research and Development Lead (CRDL), PPD (Lead Statistician), PPD (Scientific Writer), PPD (Lead statistical analyst)

ATP	According-To-Protocol
CI	Confidence Interval
CSR	Clinical Study Report
D	Diphtheria
EL.U/ml	ELISA unit per milliliter
ELISA	Enzyme-linked immunosorbent assay
Eli Type	Internal GSK database code for type of elimination code
ESFU	Extended Safety Follow-up
FHA	Filamentous hemagglutinin
GMC	Geometric mean antibody concentration
GMT	Geometric mean antibody titer
GSK	GlaxoSmithKline
HBs	Hepatitis B surface antigen
HHE	Hypotonic Hyporesponsive Episode
Hib	Haemophilus influenzae (H. influenzae) type b
IU/ml	International units per milliliter
LL	Lower Limit of the confidence interval
MedDRA	Medical Dictionary for Regulatory Activities
NOCD	New Onset of Chronic Disease
PRN	Pertactin
PRP	Polyribosyl-Ribitol-Phosphate: polysaccharide component of the Hib bacterium capsule
PT	Pertussis toxoid: a secreted exotoxin of the *Bordetella pertussis* bacterium
RCC	Reverse Cumulative Curve
SAE	Serious adverse event
SAP	Statistical Analysis Plan
SBIR	GSK Biological's Internet Randomization System
SD	Standard Deviation

SR	Study Report
T	Tetanus
TFL	Tables Figures and Listing template annexed to SAP
TVC	Total Vaccinated cohort
UL	Upper Limit of the confidence interval

CONFIDENTIAL

Statistical Analysis Plan Amendment 2 Final

1. DOCUMENT HISTORY

The complete statistical analysis plan and results presentation is divided into 2 parts: the first part detailing the analyses to be performed (known as SAP, current document) and a second part, annex (-es) (called TFL) describing the flow and format of tables, figures and listings to be annexed to the SR. For this study, there is only one annex TFL.

The following table presents the history of the statistical analysis plan development:

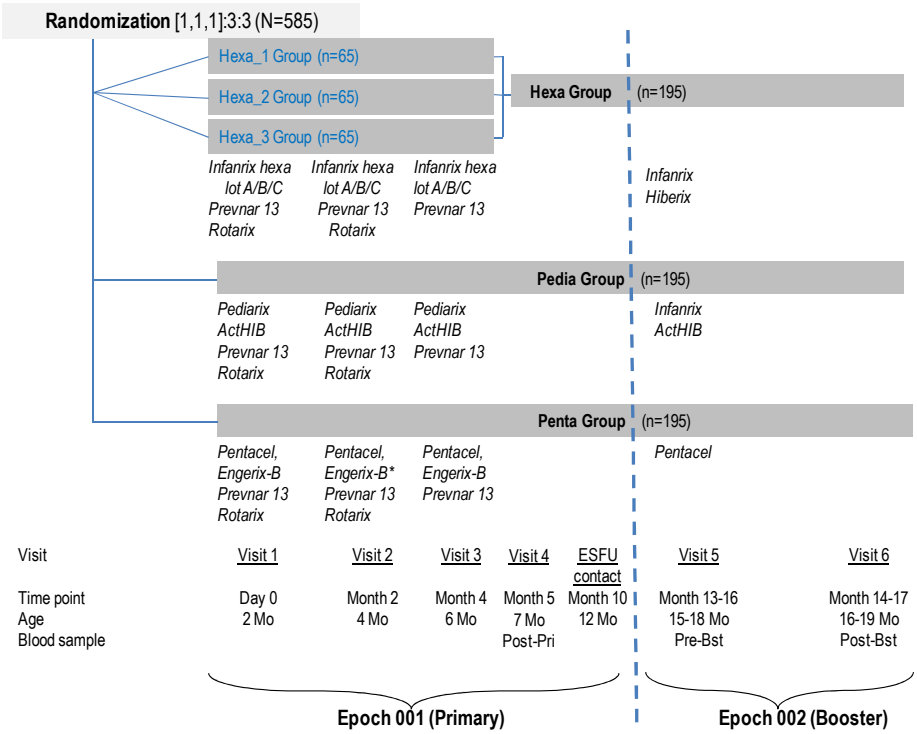
Date	Description	Protocol Version
10-Mar-2015	Version 1	Protocol Amendment 1 - 18-SEP-2014
06-May-2015	Version 2 (Amendment 1). The SAP has been updated to incorporate the changes in the sequence of analysis as per the protocol amendment 2	Protocol Amendment 2 - 17-Apr-2015
29-Nov-2017	Amendment 2*	Protocol Amendment 2 - 17-Apr-2015

* statistical analysis amendment 2 included the following changes:

1. During the course of the study, the assays used to measure the anti-D, -T, -PT, -FHA and -PRN IgG concentrations were re-developed and re-validated and both assay units and assay cut-offs were adapted. The new ELISAs for PT, FHA and PRN were calibrated against the WHO International Standard (NIBSC 06/140). This allowed the expression of concentrations measured with the new ELISAs in International Units per milliliter (IU/mL) instead of the formerly used ELISA units per milliliter (EL.U/mL). The newly validated DTPa ELISA's have a lower assay cut-off as compared to the one described in the protocol. The current assay cut-off is 0.057 IU/mL for anti-D, 0.043 IU/mL for anti-T, 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA and 2.187 IU/mL for anti-PRN. Since for anti-D, anti-T a threshold of 0.1 IU/mL provided a conservative estimate of the percentage of subjects deemed to be protected, the anti-D, anti-T seroposivity endpoints initially defined by the previous assay cut-off of 0.1 IU/mL were replaced by seroprotection rate endpoints defined as the percentage of subjects with concentration above 0.1 IU/mL. In the absence of a correlate of protection for the *B. pertussis* antigens, the pertussis vaccine response endpoints were redefined based on the assay cut-off.
2. A descriptive summary per lot was added for anti-PRP post priming.
3. The ANCOVA model was revised to include the 3 study groups rather than the 2 groups compared. This allowed identical adjusted GMC estimate regardless of the groups involved in the comparison.
4. The DTPA-HBV-IPV-135 (117119) Abridged Interim Report Main (19-Oct-2015) included immunogenicity data against Polyribosyl-Ribitol-Phosphate (PRP) antigen at Visit 4 using an assay which was not fully validated. For the final analysis, the visit 4 samples were retested together with the samples pre- and post booster using a newly validated assay. In the final analysis, the results of both assays will be descriptively presented at visit 4.

CONFIDENTIAL

2. STUDY DESIGN



N = number of subjects in the study; n = number of subjects in each group; Mo = months
Visit 3 should be conducted at least 8 weeks after Visit 2, with subjects at least 24 weeks of age, in order to comply with US recommendations on hepatitis B dosing
Post-Pri = blood sample collected from subjects, one month after the administration of the third dose in the Epoch 001
Pre-Bst = blood sample collected from subjects, before the administration of the booster dose in the Epoch 002
Post-Bst = blood sample collected from subjects, one month after the administration of booster dose in the Epoch 002
* *Engerix-B* should not be given at Month 2 (4 months of age) if a dose of hepatitis B vaccine was given at birth up to 30 days prior to study dose 1 to the subject in the Penta Group
ESFU = Extended safety follow-up

- Experimental design: Phase III, open-label, randomized, controlled, multi-centric, single-country study with five parallel groups
- Duration of the study: The intended duration of the study per subject is approximately 14-17 months.
  - **Epoch 001:** Primary, starting at Visit 1 (Day 0) and ending at safety follow up contact (i.e. six months following the third dose, Month 10),
  - **Epoch 002:** Booster, starting at Visit 5 (Month 13-16) and ending at Visit 6 (Month 14-17).

CONFIDENTIAL

117119 (DTPA-HBV-IPV-135)
Statistical Analysis Plan Amendment 2 Final

- Control: active controls.
  - Epoch 001: *Pediarix* + *ActHIB* and *Pentacel* + *Engerix-B*
  - Epoch 002: *Infanrix* + *ActHIB* and *Pentacel*.
- Vaccination schedules:

  Epoch 001

  - **Hexa Group:** Subjects in this group will receive three doses of *Infanrix hexa* (lot A, lot B or lot C as per the group allocation) co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
    - Hexa_1 Group: Subjects will receive lot A of *Infanrix hexa,*
    - Hexa_2 Group: Subjects will receive lot B of *Infanrix hexa*
    - Hexa_3 Group: Subjects will receive lot C of *Infanrix hexa*.
  - **Pedia Group:** Subjects in this group will receive three doses of *Pediarix* and *ActHIB* co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.
  - **Penta Group**: Subjects in this group will receive three doses of *Pentacel* and *Engerix-B** co-administered with *Prevnar13* at 2, 4 and 6 months of age and *Rotarix* at 2 and 4 months of age.

    *Subjects in the Penta Group who have received a dose of hepatitis B vaccine from birth up to 30 days prior to study vaccination should not receive Engerix-B at 4 months of age (Visit 2).

  Epoch 002

  - **Hexa Group**: Subjects will receive a booster dose of *Infanrix* and *Hiberix* vaccines at 15-18 months of age.
  - **Pedia Group**: Subjects will receive a booster dose of *Infanrix* and *ActHIB* vaccines at 15-18 months of age.
  - **Penta Group**: Subjects will receive a booster dose of *Pentacel* vaccine at 15-18 months of age.

  The fourth dose of pneumococcal conjugate vaccine is recommended to be administered at approximately 12-15 months of age. Since the booster dose of the candidate vaccine/active controls will be given in this study at 15-18 months of age, the fourth dose of *Prevnar13* will not be administered as part of the study protocol. Subject's parent(s)/Legally Acceptable Representative(s) (LARs) will be reminded at Visit 3 and Visit 4 to consult their primary health care provider regarding the fourth dose of *Prevnar13* at 12-15 months for their child.
- As the analyses will be performed regardless of the lot of *Infanrix hexa* received, unless otherwise specified, the Hexa_1, Hexa_2 and Hexa_3 groups will be pooled together for the analysis and will be called the Hexa group.

CONFIDENTIAL

117119 (DTPA-HBV-IPV-135)
Statistical Analysis Plan Amendment 2 Final

- Treatment allocation: The subjects will be randomized at a [1:1:1]:3:3 ratio to Hexa_1, Hexa_2, Hexa_3, Pedia and Penta groups. This will be done at study entry using GSK Biologicals' central randomization system on internet (SBIR).
- Blinding: The study is open-label for both epochs due to the differences in the number of injections and the appearance of the vaccines administered. However, the laboratory in charge of the serology testing will be blinded to the treatment, and codes will be used to link the subject and study (without any link to the treatment attributed to the subject) to each sample.
- Sampling schedule: Blood samples will be drawn from all subjects at the following time points:
  - Post-Pri (Visit 4): One month after the third dose of primary vaccination, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Pre-Bst (Visit 5): Before the administration of the booster dose, a volume of approximately 5.0 mL of whole blood (to provide approximately 1.7 mL of serum) will be collected.
  - Post-Bst (Visit 6): One month after the booster vaccination, a volume of at least 3.5 mL of whole blood (to provide at least 1.2 mL of serum) will be collected.
- Type of study: Self-contained.

The following group names will be used for the final statistical analyses:

Group order in tables	Group label in tables	Group definition for footnote	Pooled Groups label in tables	Pooled definition for footnote
1	Hexa_1 group	Subjects who received primary doses of Infanrix hexa from lot A and a booster dose of Infanrix and Hiberix vaccines	Hexa group	Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
2	Hexa_2 group	Subjects who received primary doses of Infanrix hexa from lot B and a booster dose of Infanrix and Hiberix vaccines	Hexa group	Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
3	Hexa_3 group	Subjects who received primary doses of Infanrix hexa from lot C and a booster dose of Infanrix and Hiberix vaccines	Hexa group	Subjects who received primary doses of Infanrix hexa and a booster dose of Infanrix and Hiberix vaccines
4	Pedia group	Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines	Pedia group	Subjects who received primary doses of Pediarix and ActHIB and a booster dose of Infanrix and ActHIB vaccines
5	Penta group	Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine	Penta group	Subjects who received primary doses of Pentacel and Engerix-B and a booster dose of Pentacel vaccine

3. OBJECTIVES

3.1. Primary objective

3.1.1. Epoch 001 (Primary vaccination)

- To demonstrate the non-inferiority of *Infanrix hexa* to *Pediarix* co-administered with *ActHIB*, in terms of antibody geometric mean concentrations (GMCs) for pertussis antigens [pertussis toxoid (PT), filamentous hemagglutinin (FHA) and pertactin (PRN)] one month after the third dose of the primary vaccination.

  Criteria for non-inferiority:

  Non-inferiority in terms of immune response to pertussis antigens will be demonstrated if, for each of the three antigens, the upper limit of the 95% confidence interval (CI) on the GMC ratio [Pedia divided by Hexa] is ≤ 1.5.

3.2. Secondary objectives

3.2.1. Epoch 001 (Primary vaccination)

- To assess the immune response to *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*, in terms of seroprotection status, seropositivity status and concentrations or titers of antibodies to D, T, HBs, pertussis, poliovirus types 1, 2 and 3 and PRP antigens, one month after the third dose of the primary vaccination.
- To assess the safety and reactogenicity of a 3-dose primary vaccination course of *Infanrix hexa,* of *Pentacel* co-administered with *Engerix-B,* and that of *Pediarix* co-administered with *ActHIB*, in terms of solicited local symptoms.
- To assess the safety and reactogenicity of all study vaccines in terms of solicited general events, unsolicited adverse events, new-onset chronic diseases (NOCDs) and serious adverse events.

3.2.2. Epoch 002 (Booster vaccination)

- To assess the immunogenicity of *Infanrix hexa, Pentacel, Engerix-B, Pediarix* and *ActHIB,* in terms of persistence of the antibodies to D, T, pertussis, HBs, poliovirus types 1, 2 and 3 and PRP antigens, before the booster dose.
- To assess the immune response to *Infanrix, Hiberix, ActHIB* and *Pentacel,* in terms of seroprotection status, seropositivity status and antibody concentrations or titers for D, T, pertussis and PRP antigens, and in terms of booster response for pertussis antigens following *Infanrix and Pentacel*, one month after the booster dose.
- To assess the safety and reactogenicity of booster doses of *Infanrix*, *Hiberix*, *ActHIB* and *Pentacel*.

4. ENDPOINTS

4.1. Primary endpoint

4.1.1. Epoch 001 (Primary vaccination)

- Immunogenicity with respect to pertussis components of the study vaccines *Infanrix hexa* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination.

4.2. Secondary endpoints

4.2.1. Epoch 001 (Primary vaccination)

- Immunogenicity (other parameters) with respect to the pertussis component of the study vaccines *Infanrix hexa, Pentacel* and *Pediarix.*
  - Anti-PT, anti-FHA, anti-PRN seropositivity status, one month after the third dose of the primary vaccination.
  - Anti-PT, anti-FHA, anti-PRN antibody concentrations, one month after the third dose of the primary vaccination (for *Pentacel* only).
- Immunogenicity with respect to the other components of the study vaccines *Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*.
  - Anti-D, anti-T, anti-HBs, anti-poliovirus types 1, 2 and 3 and anti-PRP seroprotection status, anti-PRP antibody concentrations ≥1.0 µg/mL and antibody concentrations/titers, one month after the third dose of the primary vaccination.
- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after each vaccination (*Infanrix hexa, Pediarix, ActHIB, Pentacel* and *Engerix-B*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after each vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after each vaccination, according to the **Med**ical **D**ictionary for **R**egulatory **A**ctivities (MedDRA) classification.

CONFIDENTIAL

- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to six months post primary vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from Day 0 up to six months post primary vaccination.

4.2.2. Epoch 002 (Booster vaccination)

- Immunogenicity with respect to all study vaccines.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-HBs, anti-PRP and anti-poliovirus 1, 2, 3 seroprotection/ seropositivity status, anti-PRP antibody concentrations ≥1 µg/mL and antibody concentrations/ titers before the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Pentacel*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN, anti-PRP seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccine *Infanrix*.
  - Anti-D, anti-T, anti- PT, anti-FHA and anti-PRN seroprotection/ seropositivity status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PT, anti-FHA and anti-PRN booster response one month after the booster dose (Dose 4).
  - Anti-D and anti-T antibody concentrations ≥1 IU/mL one month after the booster dose (Dose 4).
- Immunogenicity with respect to the study vaccines *ActHIB* and *Hiberix*.
  - Anti-PRP seroprotection status and antibody concentrations, one month after the booster dose (Dose 4).
  - Anti-PRP antibody concentrations ≥1 µg/mL one month after the booster dose (Dose 4)

CONFIDENTIAL

117119 (DTPA-HBV-IPV-135)
Statistical Analysis Plan Amendment 2 Final

- Solicited local and general symptoms.
  - Occurrence of each solicited local symptom (any, ≥Grade 2, Grade 3 and symptoms requiring medical attention) within 4 days (Day 0 – Day 3) after booster vaccination (*Infanrix, Hiberix, ActHIB* and *Pentacel*).
  - Occurrence of each solicited general symptom (any, ≥Grade 2, Grade 3, symptoms requiring medical attention, related and Grade 3 related) within 4 days (Day 0 – Day 3) after booster vaccination.
- Unsolicited adverse events.
  - Occurrence of unsolicited AEs within 31 days (Day 0 – Day 30) after booster vaccination, according to the MedDRA classification.
- Specific adverse events.
  - Occurrence of specific adverse events, i.e., new onset chronic diseases (e.g. autoimmune disorders, asthma, type I diabetes and allergies) from the booster dose up to one month after the booster vaccination.
- Serious adverse events.
  - Occurrence of serious adverse events from the booster dose up to one month after the booster vaccination.

5. STUDY POPULATION

Six cohorts are defined for the purpose of the analysis:

- Primary Total Vaccinated cohort
- Primary ATP cohort for analysis of safety
- Primary ATP cohort for analysis of immunogenicity
- Booster Total Vaccinated cohort
- Booster ATP cohort for analysis of safety
- Booster ATP cohort for analysis of immunogenicity

5.1.1. Primary Total vaccinated cohort

The Primary Total Vaccinated cohort (TVC) will include all vaccinated subjects for whom data are available.

- A safety analysis based on the Primary TVC will include all subjects with at least one vaccine administration documented.
- An immunogenicity analysis based on the Primary TVC will include all vaccinated subjects for whom data concerning at least one immunogenicity endpoint measure is available.

5.1.2. Primary ATP cohort for analysis of safety

The Primary ATP cohort for safety will consist of all subjects from the Primary TVC who complied with the protocol up to the end of Epoch 001, namely all subjects:

- who meet all inclusion criteria and no exclusion criteria for the study
- who have received all planned study vaccines for each completed vaccination visit in Epoch 001;
- for whom administration site of study vaccines is known and is according to protocol;
- who did not receive a product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.7.2 of the protocol.

Note that for the purpose of ATP cohort definition, the Epoch 001 ends at Visit 4.

Adherence to the interval related to ESFU phone contact will not be taken into account for inclusion in ATP cohort for safety.

CONFIDENTIAL

5.1.3. Primary ATP cohort for analysis of immunogenicity

The Primary ATP cohort for immunogenicity will consist of all subjects from the Primary ATP cohort for safety who complied with eligibility criteria and study procedures (see Table 5 of the protocol for the definition of the intervals) up to the post-dose 3 blood sample and had immunogenicity results for the post-dose 3 blood sample. The analysis will be performed per treatment (first dose) actually administered.

More specifically, the analysis post-dose 3 based on the ATP cohort for immunogenicity will include all eligible subjects:

- who receive all the study vaccines up to dose 3 as per the vaccination schedule;
- for whom administration site and route of study vaccines up to dose 3 is as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.7.2 of the protocol
- who did not present with a medical condition before the blood sampling at Visit 4 (Month 5) leading to elimination from an ATP analysis as listed in Section 6.8 of the protocol.
- who comply with the post-dose 3 blood sample schedule, i.e. 21-48 days post-dose 3.
- who were not administered a vaccine not foreseen by the study protocol before the corresponding post-vaccination blood sample.
- who have immunogenicity results post-dose 3.

5.1.4. Booster Total vaccinated cohort

The Booster TVC will include all subjects from primary TVC that received the booster vaccine dose.

- For the Booster-TVC analysis of safety, this will include all subjects with booster vaccine administration documented.
- For the Booster-TVC analysis of immunogenicity, this will include vaccinated subjects for whom data concerning immunogenicity endpoint measures are available.

5.1.5. Booster ATP cohort for analysis of safety

The Booster ATP cohort for safety will consist of all subjects from the Booster TVC who complied with the protocol up to the end of Epoch 002, namely all subjects:

- who meet all inclusion criteria and no exclusion criteria for the study
- who have received the planned booster dose at 15-18 months of age;

CONFIDENTIAL

117119 (DTPA-HBV-IPV-135)
Statistical Analysis Plan Amendment 2 Final

- who received 3 doses in Epoch 001;
- for whom administration site of study vaccines is known and is according to protocol;
- who did not receive a product before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis as listed in Section 6.7.2 of the protocol.

5.1.6. Booster ATP cohort for analysis of immunogenicity

The Booster ATP cohort for immunogenicity will consist of all subjects from the Booster ATP cohort for safety who complied with eligibility criteria and study procedures (see Table 5 of the protocol for the definition of the intervals) up to the post-dose 4 blood sample and had immunogenicity results for the post-dose 4 blood sample.

More specifically, the analysis pre- and post-dose 4 based on the Booster ATP cohort for immunogenicity will include all eligible subjects:

- who receive all the study vaccines up to dose 4 as per the vaccination schedule;
- for whom administration site and route of the study vaccines up to dose 4 is as per protocol;
- who did not receive a medication/product before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis (see Section 6.7.2 of the protocol);
- who did not present with a medical condition before the blood sampling at Visit 6 (Months 14-17) leading to elimination from an ATP analysis (see Section 6.8 of the protocol);
- who comply with the booster vaccination schedule at 15-18 months of age and with the post-dose 4 blood sample schedule i.e. 21-48 days for post-dose 4;
- who have immunogenicity results post-dose 4.

The list of applicable elimination codes for each cohort can be found in the study specific form FORM-BIO-CLIN-9004-05 Criteria for eliminating subjects from the analyses.

Cohort	Elimination codes	Eli Type
Primary ATP cohort for analysis for safety	1030-2100	PR
Primary ATP cohort for analysis for immunogenicity	1030-2100	PR
Booster ATP cohort for analysis for safety	1030-2100	BO
Booster ATP cohort for analysis for immunogenicity	1030-2100	BO

6. STATISTICAL METHODS

6.1. Final analysis of the Epoch 001

6.1.1. Analysis of demographics

Demographic characteristics (age [weeks], gender, geographical ancestry, height in length [cm], weight [kg] at first dose, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status will be summarised by group using descriptive statistics:

- Frequency tables will be generated for categorical variables such as center;
- Mean, median and standard error will be provided for continuous data such as age.

The distribution of subjects enrolled among the study sites will be tabulated as a whole and per group.

6.1.2. Analysis of immunogenicity

The primary analysis will be based on the Primary ATP cohort for immunogenicity. An analysis on the Primary Total Vaccinated cohort will be performed only if, in any vaccine group and at any time point, more than 5% of the vaccinated subjects with immunological data post-dose 3 are excluded from the Primary ATP cohort for immunogenicity.

The following section describes the analyses that will be performed.

6.1.2.1. Within group assessment

For each group, one month post-dose 3 and for each assay for which a serological result is available:

- Seropositivity and seroprotection rates with exact 95% CIs will be calculated.
- GMCs/GMTs with 95% CIs will be tabulated.
- For each antigen, antibody concentration or titer distribution one month post-vaccination will be tabulated and displayed using reverse cumulative curves (RCCs).
- For anti-PRP post primary vaccinate at visit 4, seropositivity and seroprotection rates and GMCs will be calculated per *Infanrix hexa* lot.

All the above within group analysis for Epoch 001, except the reverse cumulative curves and the presentation per *Infanrix hexa* lot, will also be performed by gender, by geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry), by Tdap vaccination history of mothers during pregnancy and by Hepatitis B vaccination of the subjects at birth (for anti-HBs antigen).

CONFIDENTIAL

6.1.2.2. Between group assessment

At one month post-dose 3,

- The asymptotic standardized 95% CI for the group difference (Pedia group minus Hexa group and Penta group minus Hexa group) in the seroprotection rates will be computed for each antigen.

• Antigen	• Threshold considered for protection
• Anti-D	• 0.1 IU/mL (short term protection) • 1 IU/mL (long term protection)
• Anti-T	• 0.1 IU/mL (short term protection) • 1 IU/mL (long term protection)
• Anti-polio	• 8 dilution
• Anti-PRP	• 0.15 µg/mL (short term protection) • 1 µg/mL (long term protection)
• Anti-Hbs	• 10 mIU/mL

- The 95% CI for each group GMC/GMT ratio (Pedia group divided by Hexa group and Penta group divided by Hexa group) will be computed using an Analysis of Variance (ANOVA) model on the logarithm-transformed concentrations/titers except for GMC ratio (Penta group divided by Hexa group) for pertussis antigens. The ANOVA model will include the vaccine group as fixed effect and the Tdap vaccination of the mother during pregnancy as continuous regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B at birth vaccine dose status will also be used as regressor leading to an Analysis of Co-variance (ANCOVA) model. The model will include the data from the 3 groups compared. For analysis purpose, we will consider DTP vaccination of the mother during pregnancy and Hepatitis B at birth as continuous variables. More specifically 2 continuous indicator variables will be used for Tdap vaccination of mother during pregnancy (an indicator for no Tdap vaccination at birth and an indicator for unknown vaccination at birth) while one indicator of hepatitis B at birth will be used.

6.1.2.3. Interpretation of analyses

Except for analyses addressing criteria specified in the primary objective, comparative analyses will be descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses should not be interpreted for formal conclusions since there is no adjustment for multiplicity of endpoints.

6.1.3. Analysis of safety

The primary analysis will be based on the primary Total Vaccinated cohort. If, in any vaccine group and at any time point of the Epoch 001, the percentage of vaccinated subjects excluded from the primary ATP cohort for safety is more than 5%, a second

CONFIDENTIAL

117119 (DTPA-HBV-IPV-135)
Statistical Analysis Plan Amendment 2 Final

analysis based on the primary ATP cohort for safety will be performed to complement the primary Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) or 31-day (Days 0-30) follow-up period will be tabulated after each vaccine dose and overall (for the Epoch 001) with exact 95% CI.
- The percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 4-day or 31-day follow-up period will be tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses with local AEs (solicited and unsolicited) will be calculated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines, as well as overall (all sites considered) during the 4-day follow-up period will be tabulated over the primary vaccination period, with exact 95% CI.
- The percentage of subjects/doses reporting each individual solicited local and general AE during the 4-day follow-up period will be tabulated for each group as follows:
  - Over the primary doses, the percentage of subjects with the symptom and its exact 95% CI.
  - Over the primary doses, the percentage of doses with the symptom and its exact 95% CI.
  - At each study dose, the percentage of subjects with the symptom and its exact 95% CI.

  The exact 95% CIs will be calculated assuming independence between doses.
- All computations mentioned above will be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit. The percentage of subjects/doses reporting each individual solicited local (any grade, grade 2, grade 3, medical advice) during the 4-day follow-up period will also be tabulated at each injection site for *Infanrix hexa, Pediarix, ActHIB, Pentacel and Engerix-B* vaccines with exact 95% CI after each vaccine dose and overall where the same row on the table is used for all vaccines given at the same site across the three study groups (e.g. *Infanrix hexa*, *Pentacel* and *Pediarix* together are in one row and *ActHIB* and *Engerix-B* together are in one row). The percentage of subjects/doses reporting each individual general solicited symptom (any grade, Grade ≥2, Grade 3, causally related, Grade 3 causally related, medical advice) during the 4-day follow-up period will also be tabulated with exact 95% CI. For fever, analyses will also be performed by 0.5°C increments.
- The percentage of subjects/doses with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination will be tabulated after each dose and over the Epoch 001.

- The verbatim reports of unsolicited AEs will be reviewed by a Clinical Research and Development Lead and the signs and symptoms will be coded according to MedDRA. Every verbatim term will be matched with the appropriate Preferred Term. The percentage of subjects/doses with unsolicited AEs occurring within 31 days with exact 95% CI will be tabulated by Preferred Term. Similar tabulations will be done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.
- Subjects who experienced AEs of specific interest (i.e. convulsions, Hypotonic Hyporesponsive Episode) during 31 days with exact 95% CI will be tabulated by Preferred Term. Similar tabulations will be done for AEs considered related to vaccination. Subjects who experienced AEs of specific interest will also be described in detail.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from Day 0 up to 6 months after the last primary vaccination will be tabulated by Preferred Term.
- Subjects who experienced at least one SAE reported before the database lock for the Epoch 001 analysis with an onset date in the Epoch 001 will be tabulated with MedDRA primary preferred term.
- All the above safety and reactogenicity analysis for Epoch 001 will also be performed by gender and geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry) except the percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period.

6.2. Final analysis of the Epoch 002

6.2.1. Analysis of demographics/baseline characteristics

Demographic characteristics (age [months] at Visit 5, gender, geographical ancestry, Hep B vaccination history, vaccination history of mother with respect to administration of Tdap vaccine during pregnancy) and withdrawal status will be summarized by group using descriptive statistics:

- Frequency tables will be generated for categorical variables such as race/ethnicity;
- Mean, median and standard error will be provided for continuous data such as age.

The distribution of subjects vaccinated at Visit 5 among the study sites will be tabulated as a whole and per group.

For enrolled subjects that do not participate in the Epoch 002, the reason for not participating will be summarized.

6.2.2. Analysis of immunogenicity

The primary analysis will be based on the booster ATP cohort for immunogenicity. An analysis on the booster Total Vaccinated cohort will be performed only if, in any vaccine group and at any time point of the Epoch 002, more than 5% of the vaccinated subjects with immunological data are excluded from the booster ATP cohort for immunogenicity.

The following section describes the analyses that will be performed.

6.2.2.1. Within group assessment

For each group, prior to the booster dose and one month post-booster dose and for each assay, for which a serological result is available:

- Seropositivity and seroprotection rates and booster response rates for pertussis with exact 95% CIs will be calculated.
- GMCs/GMTs with 95% CIs will be tabulated.
- For each antigen, antibody concentration or titer distribution before and one month Post-booster (when available) will be tabulated and displayed using RCCs.

All the above within group analysis for Epoch 002 except the reverse cumulative curves will also be performed by gender, by geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestries, namely White Caucasian versus any other geographical ancestry), by Tdap vaccination history of mothers during pregnancy and Hepatitis B vaccination of the subjects at birth (for anti-HBs antigen).

6.2.2.2. Between group assessment

At pre-booster and at one month post-booster,

- The asymptotic standardized 95% CI for the group difference (Pedia group minus Hexa group and Penta group minus Hexa group) in the seroprotection/ seropositivity rates will be computed for each antigen except for group difference (Penta group minus Hexa group) in the seroprotection/ seropositivity rates for pertussis antigens.

• Antigen	• Threshold considered for protection
• Anti-D	• 0.1 IU/mL (short term protection) • 1 IU/mL (long term protection)
• Anti-T	• 0.1 IU/mL (short term protection) • 1 IU/mL (long term protection)
• Anti-polio	• 8 dilution
• Anti-PRP	• 0.15 µg/mL (short term protection) • 1 µg/mL (long term protection)
• Anti-Hbs	• 10 mIU/mL

- The 95% CI for each group GMC/GMT ratio (Pedia group divided by Hexa group and Penta group divided by Hexa group) will be computed using an ANOVA model on the logarithm-transformed concentrations/titers except for GMC ratio (Penta group divided by Hexa group) for pertussis antigens. The ANOVA model will include the vaccine group as fixed effect and the Tdap vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA). For hepatitis B antigen, the hepatitis B at birth vaccine dose status will also be used as regressor leading to an ANCOVA model. The model will include the data from the 3 groups compared. For analysis purpose, we will consider DTP vaccination of the mother during pregnancy and Hepatitis B at birth as continuous variables. More specifically 2 continuous indicator variables will be used for Tdap vaccination of mother during pregnancy (an indicator for no Tdap vaccination at birth and an indicator for unknown vaccination at birth) while one indicator of hepatitis B at birth will be used.

6.2.2.3. Interpretation of analyses

In Epoch 002, all comparative analyses will be descriptive/ exploratory with the aim to characterise the difference between groups in immunogenicity. These descriptive/exploratory analyses should not be interpreted for formal conclusions since there is no adjustment for multiplicity of endpoints.

6.2.3. Analysis of safety

The primary analysis for the Epoch 002 will be based on the booster Total Vaccinated cohort and will only look at the booster dose. If, in any vaccine group, the percentage of vaccinated subjects excluded from the booster ATP cohort for safety is more than 5%, a second analysis based on the booster ATP cohort for safety will be performed to complement the booster Total Vaccinated cohort analysis.

- The percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period after the booster dose, will be tabulated with exact 95% CI for each group.
- The incidence of local AEs (solicited and unsolicited) will be calculated at each injection site as well as overall (all sites considered) for each group during the 4-day (Days 0-3) follow-up period after the booster dose.
- The percentage of subjects reporting each individual solicited local and general AE during the 4-day follow-up period will be tabulated with its exact 95% CI for each group.
- All computations mentioned above will be done for Grade ≥2 (solicited symptoms only) and Grade 3 symptoms, for symptoms considered related to vaccination (general symptoms only), for Grade 3 symptoms considered related to vaccination (general symptoms only) and for symptoms that resulted in a medically-attended visit. The percentage of subjects reporting each individual solicited local symptoms (any grade, Grade ≥2, Grade 3, medical advice) during the 4-day follow-up period will

CONFIDENTIAL

117119 (DTPA-HBV-IPV-135)
Statistical Analysis Plan Amendment 2 Final

also be tabulated at each injection site for *Infanrix, Hiberix, ActHIB* and *Pentacel* vaccines with exact 95% CI after each vaccine dose and overall where vaccination with same vaccine site is considered together (e.g. *Infanrix* and *Pentacel* together are on one row and *ActHIB* and *Hiberix* together are on one row). The percentage of subjects reporting each individual general solicited symptom (any grade, Grade ≥2, Grade 3, causally related, Grade 3 causally related, medical advice) during the 4-day follow-up period will also be tabulated with exact 95% CI. For fever, analyses will also be performed by 0.5°C increments.

- The percentage of subjects with concomitant medication, antipyretic medication and prophylactic antipyretic medication during the 4-day and 31-day follow-up period post-vaccination will be tabulated for each group.
- The verbatim reports of unsolicited AEs will be reviewed by a Clinical Research and Development Lead and the signs and symptoms will be coded according to MedDRA. Every verbatim term will be matched with the appropriate Preferred Term. The percentage of subjects with unsolicited AEs occurring within 31 days following the booster dose with its exact 95% CI will be tabulated by Preferred Term. Similar tabulations will be done for Grade 3 unsolicited AEs, for unsolicited AEs considered related to vaccination and for Grade 3 unsolicited AEs considered related to vaccination.

Additionally,

- Any large injection site reaction (defined as a swelling with a diameter > 50 mm, noticeable diffuse swelling or increase in limb circumference of greater than 50 mm) reported within 4 days (Days 0-3) following the booster dose will be tabulated.
- Subjects who experienced AEs of specific interest (i.e. new onset of chronic disease such as autoimmune disorders, asthma, type I diabetes and allergies) from booster dose up to one month after booster vaccination will be tabulated by Preferred Term.
- Subjects who experienced at least one SAE from the booster dose to study end will tabulated with MedDRA primary preferred term.

All the above safety and reactogenicity analysis for Epoch 002 will also be performed by gender and geographical ancestry (the most frequent geographical ancestry versus all other geographical ancestry, namely White Caucasian versus any other geographical ancestry) except percentage of subjects with at least one local AE (solicited and unsolicited), with at least one general AE (solicited and unsolicited) and with any AE during the 4-day (Days 0-3) and 31-day (Days 0-30) follow-up period after the booster dose.

7. STATISTICAL CALCULATIONS

7.1. Derived and transformed data

7.1.1. Demography

For a given subject and a given demographic variable, missing measurement will not be replaced excepting for age.

Age will be calculated as the number of years between the date of birth and the date of vaccination.

To ensure that the collection of date of birth will not jeopardise the privacy of personally identifiable information, only a partial date of birth (MMYYYY) will be collected.

Therefore, the 15th of the month will be used to replace the missing date. In case the day and the months are missing, the date will be replaced by the June 30th of the year.

7.1.2. ImmunogenicityA seronegative subject is a subject whose antibody concentration/titer is below the assay cut-off.

- A seropositive subject is a subject whose antibody concentration/titer is greater than or equal to the assay cut-off.
- Note: Due to re-validation of all assays, the cut-offs presented in Table 7 of the protocol have changed as follows

• Antigen	• Threshold for positivity
• Anti-PT	• 2.693 IU/mL
• Anti-FHA	• 2.046 IU/mL
• Anti-PRN	• 2.187 IU/mL
• Anti-D	• 0.057 IU/mL
• Anti-T	• 0.043 IU/mL
• Anti-polio	• 8 dilution
• Anti-PRP	• 0.15 µg/mL (assay not fully qualified) • 0.066 µg/mL (new validated assay)
• Anti-Hbs	• 6.2 mIU/mL

CONFIDENTIAL

- A seroprotected subject is a subject whose antibody concentration/titer is greater than or equal to the level defining clinical protection. The following seroprotection thresholds are applicable:
  - Anti-diphtheria antibody concentrations ≥ 0.1 IU/mL.
  - Anti-tetanus antibody concentrations ≥ 0.1 IU/mL.
  - Anti-HBs antibody concentrations ≥ 10 mIU/mL.
  - Anti-poliovirus types 1, 2 and 3 antibody titers ≥ 8.
  - Anti-PRP antibody concentrations ≥ 0.15 µg/mL.
- Other cut-offs to be considered:
  - Anti-PRP antibody concentrations ≥ 1.0 µg/mL.
  - Anti-diphtheria and anti-tetanus antibody concentrations ≥ 1.0 IU/mL
- Booster responses for anti-PT, anti-FHA and anti-PRN antibodies are defined as:
  - initially seronegative subjects (pre-booster antibody concentration below the assay cut-off) presenting an increase of at least four times the assay cut-off one month after vaccination,
  - initially seropositive subjects with antibody concentration < four times the assay cut-off presenting an increase of at least four times the pre-booster antibody concentration one month after vaccination
  - initially seropositive subjects with anti-body concentration ≥ four times the assay cut-off presenting an increase of at least two times the pre-booster antibody concentration one month after vaccination
- The GMC/GMT calculations will be performed by taking the anti-log of the mean of the $\log_{10}$ titer/ concentration transformations. Antibody titers/concentrations below the cut-off of the assay will be given an arbitrary value of half the cut-off for the purpose of GMC/GMT calculation.
- Handling of missing data - For a given subject and a given immunogenicity measurement, missing or non-evaluable measurements will not be replaced.

7.1.3. Safety/reactogenicity:

- For a given subject and the analysis of solicited symptom within 4 days post-vaccination, missing or non-evaluable measurements will not be replaced. Therefore the analysis of the solicited symptoms based on the Total Vaccinated cohort will include only vaccinated subjects and doses with documented safety data (i.e. symptom screen completed).
- For analysis of unsolicited adverse events, such as serious adverse events or adverse events by primary MedDRA term, and for the analysis of concomitant medications, all vaccinated subjects will be considered. Subjects who did not report the event or the concomitant medication will be considered as subjects without the event or the concomitant medication respectively.

CONFIDENTIAL

- For analysis of convulsion, the adverse event will be identified by using narrow standard MedDRA query.
- For analysis of Hypotonic Hyporesponsive Episode (HHE), the adverse event will be identified by using broad standard MedDRA query.
- For analysis of New Onset of Chronic Illness (NOCI), the adverse event will be identified by using narrow standard MedDRA query.
- For summaries reporting both solicited and unsolicited adverse events, all vaccinated subjects will be considered. Subjects for whom the event will not be reported will be considered as subjects without the event.
- Large injection site reactions are defined as either swelling with a diameter of >50 mm or a >50 mm increase in the circumference of any limb when compared to the baseline (pre-vaccination) measurement, or any diffuse swelling that interferes with or prevents everyday activities (for example, active playing, eating, sleeping).
- For the analysis, temperatures by any route will be coded as follows:

Grade	Temperature
0	< 38.0°C
1	≥ 38.0°C - ≤ 39.0°C
2	> 39.0°C - ≤ 40.0°C
3	> 40.0°C

- The way the percentage of subjects will be derived will depend on the event analysed (see table below for details). As a result, the N value will differ from one table to another.

Event	N used for deriving % per subject for Vaccination phase
Concomitant vaccination	All subjects with study vaccine administered
Solicited general symptom	All subjects with at least one solicited general symptom documented as either present or absent (i.e. symptom screen completed)
Solicited local symptom	All subjects with at least one solicited local symptom documented as either present or absent (i.e. symptom screen completed)
Unsolicited symptom	All subjects with study vaccine administered
Concomitant medication	All subjects with study vaccine administered

CONFIDENTIAL

7.2. Data presentation description

The following decimal description from the decision rules will be used for the demography, immunogenicity and safety/ reactogenicity.

Display Table	Parameters	Number of decimal digits
Demographic characteristics	Mean, median age	1
Demographic characteristics	SD (age)	1
anti-T	GMC	3
anti-D	GMC	3
anti-PT	GMC	1
anti-PHA	GMC	1
anti-PRN	GMC	1
anti-HBs	GMC	1
anti-PRP	GMC	3
anti-Polio 1	GMT	1
anti-Polio 2	GMT	1
anti-Polio 3	GMT	1
Immunogenicity	Ratio of GMT/C	2
Reactogenicity	Mean, Min, Q1, Median, Q3, Max for duration	1
All summaries	% of count, including LL & UL of CI	1
All summaries	% of difference, including LL & UL of CI	2

7.3. Methodology for computing confidence intervals

- All CI computed will be two-sided 95% CI.
- The exact 95% CIs for a proportion within a group will be based on the method by Clopper [Clopper, 1934*].
- The standardised asymptotic 95% CI for the group difference in proportions will be based on the method 6 described in paper by Newcombe [R Newcombe, 1998, method six**].
- The 95% CI for geometric mean titers/concentrations (GMTs/GMCs) will be obtained within each group separately. The 95% CI for the mean of log-transformed titer/concentration will be first obtained assuming that log-transformed values were normally distributed with unknown variance. The 95% CI for the GMTs/GMCs will be then obtained by exponential-transformation of the 95% CI for the mean of log-transformed titer/concentration.

  The GMC/GMT group ratio will be computed using an ANOVA model on the logarithm10 transformation of the concentrations/titers. The ANOVA model will include the vaccine group as fixed effect and the Tdap vaccination of the mother during pregnancy as regressor leading to an Analysis of Co-variance (ANCOVA) model. For hepatitis B antigen, the hepatitis B vaccination at birth vaccine dose status will also be used as regressor leading to an Analysis of Co-variance (ANCOVA) model.

CONFIDENTIAL

8. CONDUCT OF ANALYSES

8.1. Sequence of analyses

The analyses will be performed stepwise:

1. A partial analysis of Epoch 001 up to one month after the third primary vaccine dose will be conducted. This analysis will include the final analysis of anti-PRP, solicited and unsolicited symptoms on data as clean as possible. This analysis will be displayed on GSK clinical trial registry as soon as possible.
2. The final data analysis of the study covering both the epochs will be conducted at the end of the study. All these analyses will be presented in a final clinical study report.

Following analysis folder will be created in SDD and CARS with given analysis ID to perform analysis and archival of statistical reports

Description	Analysis ID (SDD & CARS sub-folder)	Disclosure	TFL reference
Primary Epoch - Anti-PRP and safety	E1_01	CTRS	From TFL Version 1 dated 10-Mar-2015, following tables will be generated for time point - one month post vaccination dose 3. • Post-Text table section – Table-29, 34, 35, 38, 39. • CTRS table sections – Table 1-5, 10, 12-15) • Annex table section – Table 3 Please note that the tables from post text section will be generated with output destination 'ANNEX'.
Final	E1_02	CTRS, Clinical Study report, Publication	TFL Version 2 dated 17-Nov-2017

8.2. Statistical considerations for interim analyses

All analyses will be conducted on final data and therefore no statistical adjustment for interim analyses is required.

9. MAJOR CHANGES FROM PLANNED ANALYSES

The following are the changes in the SAP from the protocol:-

- The analysis of percentage of doses followed by at least one local AE (solicited and unsolicited), by at least one general AE (solicited and unsolicited) and by any AE during the 31-day (Days 0-30) follow-up period will not be tabulated over the primary vaccination period and also over booster vaccination period, with exact 95% CI. Also the same analysis by gender and geographical ancestry will not be performed.
- During the course of the study, the assays used to measure the anti-D, -T, -PT, -FHA and -PRN IgG concentrations were re-developed and re-validated and both assay units and assay cut-off were adapted. The new ELISAs for PT, FHA and PRN were calibrated against the WHO International Standard (NIBSC 06/140). This allowed the expression of concentrations measured with the new ELISAs in International Units per milliliter (IU/mL) instead of the formerly used ELISA units per milliliter (EL.U/mL). The newly validated DTPa ELISA's have a lower assay cut-offs as compared to the one described in the protocol. The current assay cut-off is 0.057 IU/mL for anti-D, 0.043 IU/mL for anti-T, 2.693 IU/mL for anti-PT, 2.046 IU/mL for anti-FHA and 2.187 IU/mL for anti-PRN. Since for anti-D, anti-T a threshold of 0.1 IU/mL provided a conservative estimate of the percentage of subjects deemed to be protected, the anti-D, anti-T seroposivity endpoints initially defined by the previous assay cut-off of 0.1 IU/mL were replaced by seroprotection rate endpoints defined as the percentage of subjects with concentration above 0.1 IU/mL. In the absence of a correlate of protection for the *B. pertussis* antigens, the pertussis vaccine response endpoints were redefined based on the assay cut-off.
- A descriptive summary per lot was added for anti-PRP post priming.
- The ANCOVA model was revised to include the 3 study groups rather than the 2 groups compared. This allowed identical adjusted GMC estimate regardless of the groups involved in the comparison.
- The DTPA-HBV-IPV-135 (117119) Abridged Interim Report Main (19-Oct-2015) included immunogenicity data against Polyribosyl-Ribitol-Phosphate (PRP) antigen at Visit 4 using an assay which was not fully validated. For the final analysis, the visit 4 samples were retested together with the samples pre- and post booster using a newly validated assay. In the final analysis, the results of both assays will be descriptively presented at visit 4.

Study Administrative Table

Clinical Trial Activity	Performed by	Responsibilities and scope of activities	Site address
Monitoring	Central Study Monitor (Central Study co-ordinator)	• co-ordinates operational aspects of running the study from preparation of study supplies and data capture tools, to study tracking • has regular contacts with local monitors in order to review the study progress and any issue raised by the local monitor. In this way compliance with the protocol and GCP/ICH guidelines is ensured during preparation, active and cleaning phases of the study • is responsible for maintaining and archiving a comprehensive study file. If required, transitioning of a study from one monitor to another is documented in the study file • is responsible for reviewing and signing off of the clinical study report	GlaxoSmithKline Biologicals Rue de l'Institut 89, 1330 Rixensart (Belgium)
Monitoring	Local Monitor	*Prior to study start:* • is responsible for the evaluation of the study site and ensures that the staff and facilities are trained and appropriate for running of the study according to protocol and GCP guidelines • is involved in the preparation of study package for submission to Ethics Committee and/or Independent Review Board (EC/IRBs) and appropriate authorities	GSK United States: GlaxoSmithKline Biologicals Slaoui Center for Vaccine Research, 14200 Shady Grove Road, Rockville MD 20850. Novella: 1700 Perimeter Park Dr, Morrisville, NC 27560

Clinical Trial Activity	Performed by	Responsibilities and scope of activities	Site address
		At study initiation: • conducts study specific training *While trial is ongoing*: • discusses all aspects of the trial with the study staff • verifies source documents and Case Report Forms (CRFs) • conducts a 100% review of all Informed Consent documentation • checks accountability of investigational product and its storage conditions • checks the collection and storage of biological samples and transport to central laboratory • reviews each SAE report All monitoring visits are documented via a monitoring visit report (MVR), which will be reviewed by the monitor's manager. These reports allow the identification of protocol violation, re-education of site staff and communication of significant issues (SAEs, quality, efficacy and GCP compliance) to the central organisation. In this way the Local Monitors oversee the progress of the clinical trial and ensure that it is conducted, recorded and reported in accordance with the protocol and current GCP/ICH guidelines. The Local Monitor works in close partnership with the Local Medical Advisor and the Central Study Monitor.	

Clinical Trial Activity	Performed by	Responsibilities and scope of activities	Site address
Data Management	Data Manager	Responsibilities involve: • the design of the Case Report Form (CRF) • the creation of data entry application • the collection and handling of study data • the cleaning of study data (in conjunction with the Clinical Development Manager, Central Study and Local Monitors) in order to provide cleaned database for the statistical analysis	GlaxoSmithKline Biologicals Rue de l'Institut 89, 1330 Rixensart (Belgium)
Statistics	Statistician	• is involved in the study design and is responsible for calculating the sample size, preparation of the randomisation list, identification of appropriate statistical tests to analyse the data, conducting the statistical analysis on the data collected, issuing the statistical report and interpretation of the statistical findings • reviews the final study report to ensure that all aspects of the statistical analysis and findings are accurately represented in the final report	GlaxoSmithKline Biologicals Rue de l'Institut 89, 1330 Rixensart (Belgium)

Laboratory assessments	GlaxoSmithKline Biologicals,
